# CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields. Published by the MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg and London, Eng.

Vol. XIII | Publication Office: Toronto, January 7, 1915 | No. 1

## Keep Up A Full Head of Steam

FOLLOWING our usual custom we have again reserved for our own message the front cover of the first issue of Canadian Machinery in the New Year.

¶ It has been persistently predicted that Canada in the near future will enter upon a period of unexampled industrial development and expansion. It has been prophesied that our industries will be called upon to produce to an extent far beyond their present capacity. That our farmers for several years to come will enjoy unprecedented prosperity.

¶ These predictions, when all the facts are considered, seem reasonable, and that they are capable of fulfillment seems to be recognized by some of our leading manufacturers, who are already overhauling their plants and equipment and in other ways preparing to handle the inevitable increased demand.

¶ If your particular product can be used by manufacturers in the machinery and metal working trades, tell them about it in Canadian Machinery, NOW. Get your "reasons why" before them when they are considering their requirements—not after they have purchased.

¶ He has a false idea of advertising who thinks he can throw open the throttle after a while and overtake the man who has advertised persistently and confidently. It can't be done and he'll realize it perhaps too late.

¶ *You* can't let your advertising fires die out and expect to have a full head of steam to meet a sudden demand for power. It can't be done. Why not start a campaign early in the New Year and stake your claim to some of the business that is undoubtedly ahead?

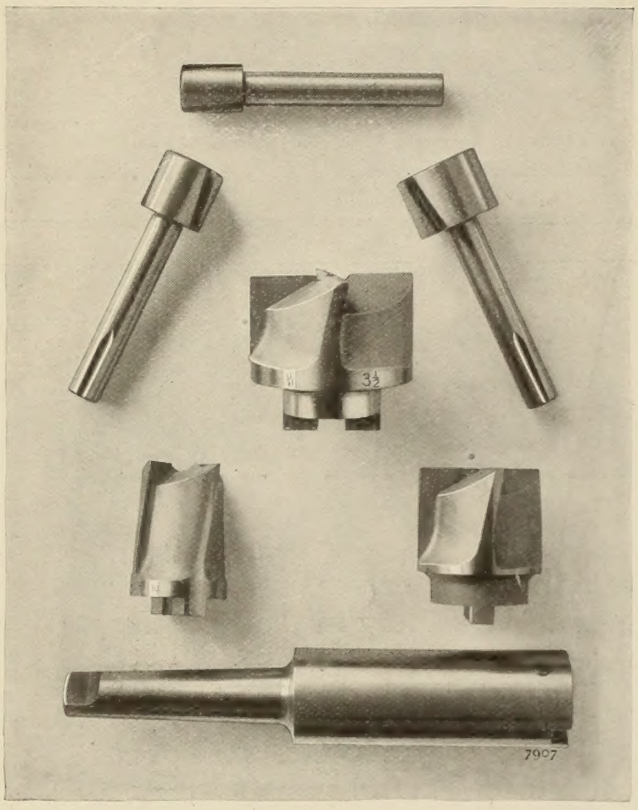
¶ Canadian Machinery will bring your message before responsible buyers in the best Machine Shops, Engineering and Railway Shops, Iron and Steel Mills, Foundries, Boiler and Forge Shops, etc., in the Dominion. Through this one medium you can cover the entire field.

¶ We have open a limited number of front covers for 1915. If you act quickly you may be able to secure one in connection with a regular campaign.

¶ Let us send you full particulars to-day.

CANADIAN MACHINERY

# Make Your Own Combination



For every counterboring job you can make up immediately the right combination of holder, cutter and guide if your tool room is equipped with

## P. & W. Interchangeable Cutter Counterbores

Holders, Cutters and Guides furnished in wide range of sizes.

### Holders

End of holder is milled to receive the driving lug of the cutter and there is also a hole and set screw to accommodate the shank of the guides.

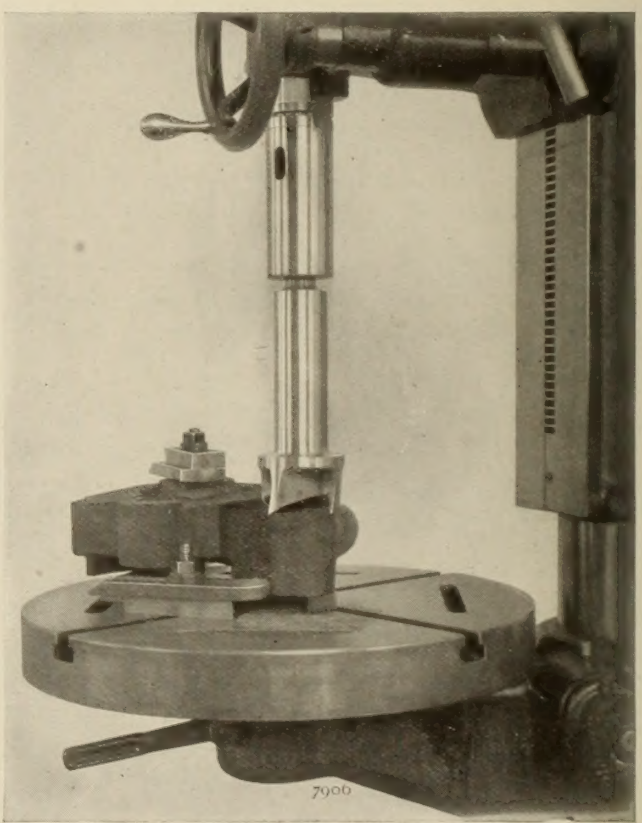
### Guides

Are of hardened tool steel. They are held in place by means of a set screw in the holder engaging a V slot in the shank of the guide.

### Cutters

Are furnished of either carbon or high-speed steel. The shank of the guide passes through the hole in the cutter and the shoulder between the guide and its shank keeps the cutter in place. Cutters can be sharpened on the face and the guide is simply pushed further in the hole after grinding.

*Write for catalog "Small Tools" showing our complete line.*



**Spot Facing**
with a P. & W. Interchangeable Cutter Counterbore.

**Place a trial order with our nearest store.**

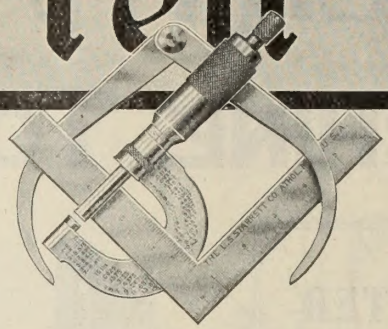
# Starrett Tools

The Finest Tools



Made by the World's Greatest Toolmakers

## For 1915-Your Usual Accuracy With Greater Efficiency

We are facing a year of the greatest prosperity we have ever seen. Particularly in the machinery field, business is increasing remarkably. To meet this, every plant must maintain its quality and increase its output—every workman, to advance in position, must do good work and plenty of it.

### Why Starrett Tools Are Important

You may think that the tools used in the toolroom or at the bench are unimportant details of the whole shop. Perhaps so,--but we know that the toolroom having a proper equipment of big micrometers, vernier calipers, and the large size ordinary calipers will help to speed up the measuring operations of the men. Mechanics whose small tools include a proper variety of all kinds of rules, calipers, dividers, micrometers, surface gages, vernier calipers, squares, protractors, etc., will also find that they work more rapidly, while keeping up to their usual accuracy, than they could otherwise.

### How To Select The Proper Tools

Perhaps there are tools just suited for your shop or to your own work with which you are not familiar. At any rate it will do no harm to write to us for our 320-page free catalog describing 2100 styles and sizes of tools and hack saws because it may show something you should have. Drop us a postal and ask for catalog No. 203.

### Where To Buy Them

You can buy Starrett Tools at any good hardware store. Hack saws in quantity or the big toolroom instruments may be purchased from us direct or at machinery supply houses.

# WHAT ABOUT YOUR 1915 SALES?

Are you going after business next year with the avowed intention of getting it, believing you will get it, and with adequate preparation for getting it?

If you are, you'll get it. It may not be big business, but it may be very satisfactory at that. The prospect is far from discouraging. If you go after business determinedly, you will at least get your share.

It must be a year of resourceful selling. Every legitimate means must be used to keep the wheels turning. It will be no time for weak effort or faint hearts.

And if your salesmen shall be required to redouble their energy and enthusiasm, does it not sound reasonable that your advertising should be likewise increased?

Is it to be a time when your salesmen must shout, and your advertising be so weak as to only whisper? Will it be a time of full-page salesmen, and eighth-page advertising? Of salesmen who work week in and week out, and advertising that only has a chance to work once a month?

Rather be well advised and make your 1915 publicity as virile, as enthusiastic, and as confident as you expect your salesmen to be.

Why not arrange *now* to commence a vigorous campaign in CANADIAN MACHINERY, beginning with the first issue in January? Rate cards and full particulars will be supplied upon request.

With this journal, and this one alone, you can reach the best buyers in the Machine Shops, Railway Shops, Forge Shops, and General Engineering and Metal Working Plants of Canada.

# Organization and Other Features, M.C.R. Shops, St. Thomas

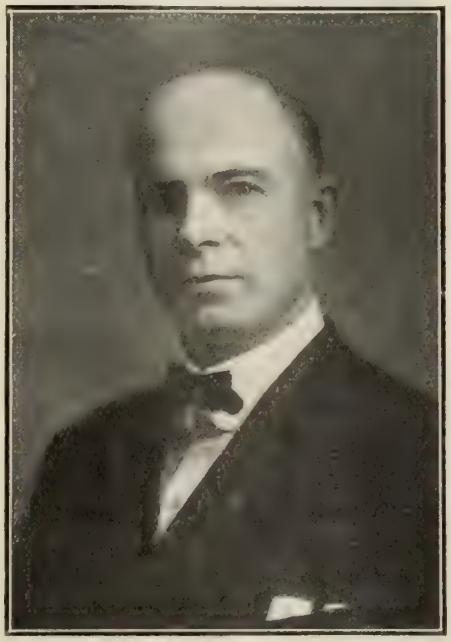
Staff Article

*Railroads more so than any other department of industrial enterprise are progressive, and ample proof of the statement is to be found in the great terminal and auxiliary shops of all of the companies doing business in and beyond the Canadian border. The M. C. R. is among the latest to modernize its plant and equipment to meet its growing needs.*

## APPRENTICESHIP SYSTEM

FOLLOWING the introductory remarks on page 586 of our December 31 issue, on the apprenticeship system as adopted by the Michigan Central Railroad Shops at St. Thomas, Ont., it may be here stated that an attempt is made to graduate the education as much as possible to coincide with the student's work in the shop. The course includes simple mathematics such as elementary arithmetic and sufficient algebra to enable him to handle simple formulae. Physics includes leverage, inclined plane, simple triangulation, etc. Under the heading of applied mechanics comes, mensuration, simple problems in strength of materials, gearing, simple machines and the like. Particular attention is, of course, given to the theory and construction of steam engines and valve motions.

The apprentice also receives a good practical course in drafting along the lines adopted by the New York Central System which includes sketching, tracing and blue-printing. The class room is situated on the second floor of the old building adjacent to the business offices. It is well lighted by windows on two sides and is provided with black boards, drawing benches, stools, etc. The equipment also includes models of steam engines, and the various valve gears in use on locomotives. There are also types of



E. R. WEBB, DIVISION MASTER MECHANIC.

lubricators, injectors and other engine attachments as well as pulleys, scales, weights, etc., for the illustration of physics. The whole, while comprising an outfit particularly adapted to railroad work is one which many technical schools can study with profit.

The apprentice system of the Michigan Central Railway is decidedly excellent from both a business and humanitarian point of view. All of its good points are no doubt unappreciated by the apprentices themselves until such time as they branch out to find work and experience in other plants. The benefits to be derived from surrounding the institution with a distinctly superior type of men and officials has been found to be one of the best assurances of its success and the money invested in the man through the apprentice system is coming back in the form of a general contentment and good will, and a remarkable and highly creditable absence of labor disputes.

### The Organization.

To the thoughtful observer the plant and its working reflects the character, the personality and even the peculiarities of the men who direct. It has been said by a great business man that the traveler desiring to sell goods and the mechanic seeking employment can best understand the man at the helm by a study of the atmosphere and spirit

WEST SIDE OF HEAVY MACH INE BAY, LOOKING NORTH.

which pervades his place of business. To the railroad man the organization of the railroad shop is easily comprehended and, perhaps, presents few points of interest. Nevertheless, the railroad business is probably the most competitive one in America to-day and, considering the vastness of its field, the variety of shop work involved is not large, both of which considerations go to make the official of the railroad shop the best authority on such points of shop government as come within his sphere.

The shops and terminal works come under the department of the superintendent of motive power who exercises a personal supervision over the general details. The shops themselves come more directly under the office of the divisional master mechanic and his assistant in all cases where mechanical details and expediency are concerned. This office is very much similar to that of the general superintendent of our larger manufacturing concerns and, like it, covers all the departments of the plant. The machine shops are directly under the supervision of a general foreman through department heads which, in the case of the shops at St. Thomas, consist in general of machine shop foreman and assistant, erecting shop foreman, tool room foreman, etc. In conjunction with this office and also directly under the master mechanic is the chief draughtsman who also superintends the technical training of the apprentices.

### Piecework Rate System.

A guaranteed rate piece work system is employed which, when operated upon the equitable basis maintained by this company is, without doubt, very satisfactory to both officials and operatives. The rating of all piece work is governed by a general policy of the company and is directed by the general supervisor of piece-work through a chief inspector and a local supervisor inspector in each shop. This item in the shop management is given primary importance.

In setting the rate for a new job, the basis adopted is 25 per cent. in excess of the day rate for the class of man involved. After a careful study of the records of other shops of the company concerning the particular piece of work and taking into account the conditions prevailing in the local shop, a trial rate is set. This is written upon a special form which bears the signatures of five company officials which include the divisional superintendent, master mechanic, supervisor of piece-work, chief piecework inspector and the local piece-work inspector.

After the job has been thoroughly tried out and the workman and others concerned have been given opportunity to make any desired comments, the rate is confirmed or corrected and, after being entered upon a final form receives the same signatures as before and, in addition those of the general foreman and the mechanic himself. Having reached this stage, the rate for the particular work in question is not altered either in

GEORGE CARR,
General Foreman, M.C.R. Shops, St. Thomas.

favor of the company or the employee. In fact, the broad general statement is made that no price after having once been set has ever been changed.

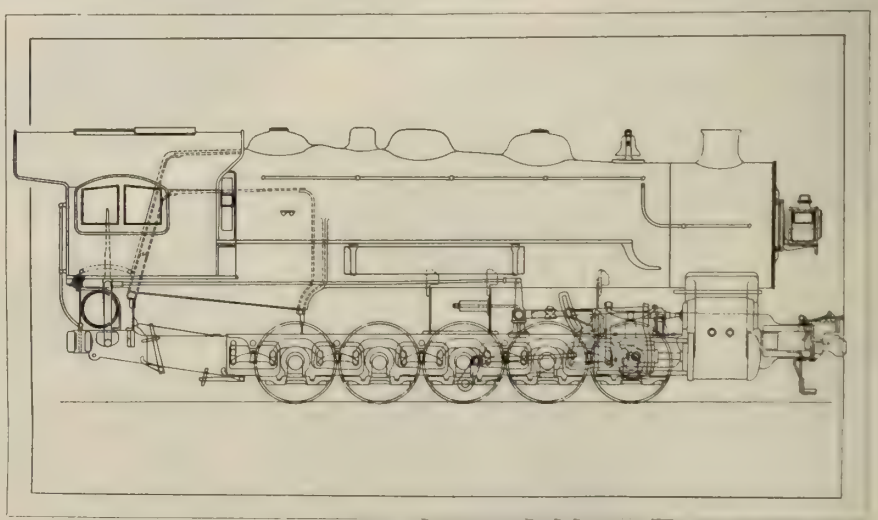
The advantage of this rigid rate discipline is apparent. The man devotes both his head and his hands to the production of more and a better quality of work, being assured that his efforts will be proportionately rewarded independently of the extent of his success. The result of this has been that a number of was originally intended by either party to the agreement. The result, however, is obtained usually without increase of floor space or capital investment on the part of the company and hence is satisfactory to both.

Piece-work systems, as a rule, have suffered failure more or less complete through their vulnerability to the cupidity of both employer and employee. The success of this M. C. R. Co. at St. Thomas, goes to show that even organized workmen are not unchangeably opposed to a system based on fairness and sound business principles, and which is administered by men whose personality and integrity are strong and beyond reproach.

The different stages in dismemberment and reconstruction are performed by separate crews or "gangs." Each gang adheres strictly to its range of work, but the men are interchangeable within the crew. Every gang has its portable outfit and tool box which is taken from one engine to another. In this way the work is done with the least interference and expenditure of time, and some very creditable records have been established. The routing of the work also has received a great amount of attention and has been brought to such a condition as to almost look after itself. The relieving of the foremen of many such details has permitted a much greater proportion of his time to be devoted to the more important work of planning and strict supervision.

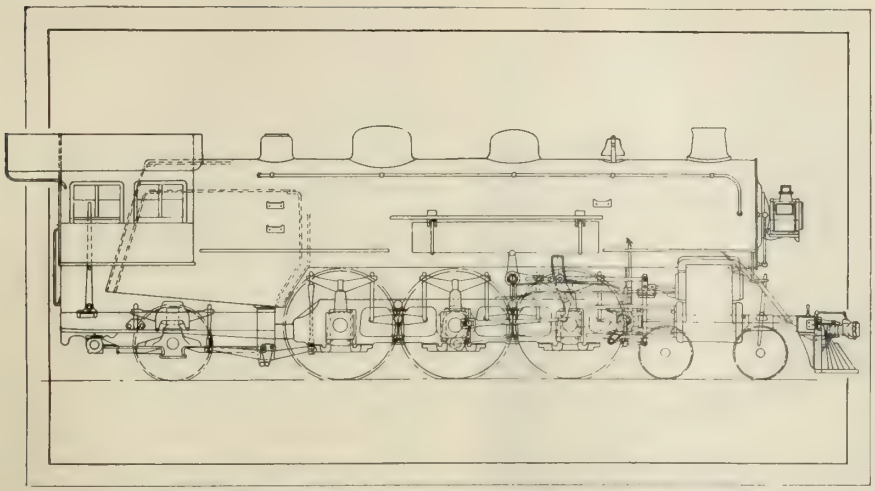
### Safety First and Workmen's Welfare.

Precautions for the safety of workmen and the continuous and smooth working of machinery leave little to be desired. Most of the machines are of the more advanced types which come amply provided with gear and belt guard, and safety attachments. These have been



N.Y.C. SWITCHING LOCOMOTIVE, CLASS M. WORK OF APPRENTICE SCHOOL, M.C.R. SHOPS, ST. THOMAS.

men have been able to so contrive labor and time-saving devices that their monthly wage is very much in excess of what largely supplemented by the shop management where deemed necessary or advisable, and all cranes, line shafting and



N.Y.C. PACIFIC TYPE PASSENGER LOCOMOTIVE. WORK OF APPRENTICE SCHOOL, M.C.R. SHOPS, ST. THOMAS.

other moving parts have been fully guarded.

Large and conspicuous warning signs are placed in all dangerous places so that a workman cannot be long in the institution without acquiring the "Take care" habit. Upon each individual machine is placed a striking, small red and white sign admonishing the operator to stop the machine before oiling or cleaning it.

The shop is provided with a medicine cabinet containing all first aid appliances and drugs, and provision is made by the brotherhood for the care of injured men as long as they remain incapacitated. The company are in the possession of some very interesting records bearing upon the benefits direct and indirect accruing from the "safety first" efforts. Suffice to say that the prevention from injury and the maintenance of the individual health of the employees have proved a very profitable and humanitarian investment.

**Sanitary Arrangements.**

A well appointed lavatory has been erected near the centre of the building on the west side. It is equipped with 56 individual enameled cast iron wash basins which are supplied with hot and cold water. The walls are lined with over 200 "Dennisteel" expanded metal lockers. The sanitary arrangements are of the same general good quality and the whole is so arranged as to afford the best facilities for cleaning. An unusual feature is the installation of a number of unobtrusive sanitary conveniences at strategical points about the shop. These are located at the bases of columns in such a way that they would most likely pass notice unless attention were called to them. Neat and substantial porcelain sanitary drinking fountains are distributed at convenient points throughout the shop. The aim in every respect has been the health of the employees, coupled with the best facilities for maintaining cleanliness.

**The Power and Heating Plant.**

A new power house has been built to the southeast of the new round house, and between it and the car shops. The building is approximately 87 feet square, and is divided by a single wall running east and west into boiler and engine room, each of which is 42 feet wide inside. The construction of the building is very similar to the new locomotive shops. The concrete foundation extends up to the lower sill line. Upon this rest the brick walls which, in turn, support the roof trusses. The side walls consist of a very large proportion of glass area more than half of which is made up of ventilated sections. The glass itself consists of ⅛ inch factory ribbed glass supported in continuous steel sash. The roof slabs of reinforced concrete are supported on I beam purlins and are covered wth five-ply roofing material.

Under the boiler room is an ash tunnel which traverses its whole length. This is provided with a track and leads to a pneumatic elevator by means of which the ashes are hoisted to be conveniently dumped into cars for removal. A basement extends under the greater portion of the engine room and is used to accommodate the transformer units. The south or boiler room side is occupied by a coal bin of 300 tons capacity which extends the full length of the building. Over the coal bunker is a wood trestle up which loaded coal cars can be switched and dumped into the bin below. Smoke and products of com-

APPRENTICE CLASS ROOM SHOWING DRAWING BENCHES AND MODELS.

LAVATORY SHOWING BASINS AND EXPANDED METAL LOCKERS.

bustion are taken care of by an Alphons-Custodis radial brick chimney 7½ feet inside diameter and 150 feet high. A concrete tunnel 6 ft. high and 4 ft. wide leads from the power house to the car shops for the purpose of carrying the steam and compressed air lines. From this point they are distributed overhead to the woodworking departments, yards and locomotive shops. A suction system with its attendant piping and separating apparatus has been installed for the purpose of collecting all the sawdust, shavings and similar wood refuse and delivering it to two of the boiler furnaces which have been specially arranged to burn this kind of fuel. Previous to the building of the new power plant this refuse had been disposed of by manual labor.

**Equipment.**

The boiler room is equipped with four 250 h.p. Goldie & McCulloch water tube boilers designed for a working pressure of 160 pounds per square inch. The furnaces are fitted with Green traveling chain grate stokers. From the bunkers directly in front of the boilers. The coal is shovelled into hoppers from which it is taken by the moving chain grate. The ashes and clinker drop from the grates into sloping chambers underneath the boilers. From these, they are raked into buggies which, as before stated, are hoisted out and dumped into cars for the purpose.

A steel breeching connects the furnaces with the stack which gives abundant natural draft. A special steam blowing arrangement is provided which greatly facilitates cleaning and general combustion. The steam main runs along the division wall on the boiler room side, the supply for the various units being taken through the wall to the engine room side.

For the development of electrical energy, a 22 x 42 inch Corliss engine built by E. Leonard & Sons, of London, Ont., has been installed. This engine is fitted with an extra heavy fly wheel and is direct connected to a 375 k.v.a., 575-volt, 3-phase, 25-cycle Canadian General Electric generator, the exciting current for which is furnished by an 18½ k.w. belt driven generator.

NEW POWER PLANT.

The electrical apparatus was designed to conform to the standards adopted by the Ontario Hydro Electric Commission so as to permit the use of this current as well as that developed at the plant. It has been found after careful investigation that power, as such, can be purchased more cheaply than it can be developed from coal. Power, therefore, is only developed in the winter time when the exhaust steam is required for heating purposes.

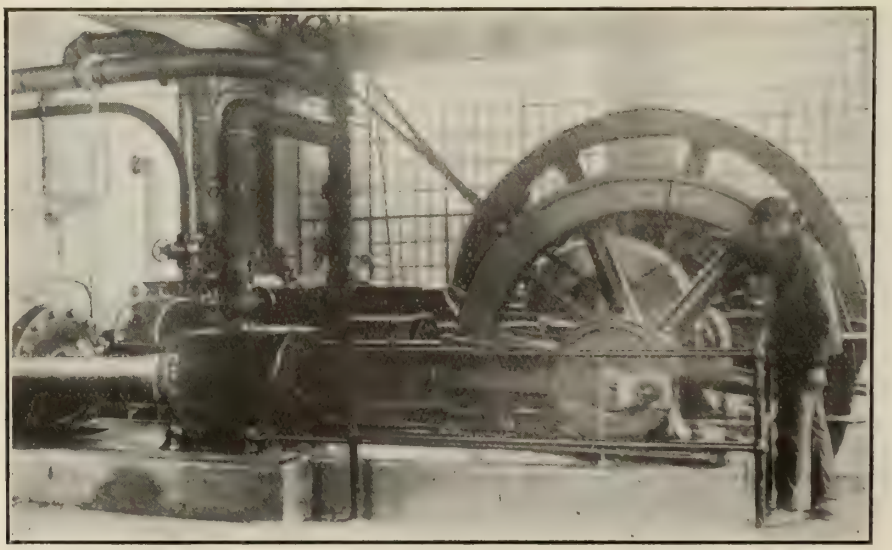
The high tension lines of the Hydro-Electric Commission are led into a pent house built on the roof of the building at the northeast corner. This compartment is 6 ft. 4 in. wide and 10 ft. 6 in. long and is high enough to enclose switches, lightning arresters and all other receiving apparatus. These high tension switches are controlled from the engine room floor so that the operator need not go near these dangerous parts except upon special occasions for making alterations or repairs.

The current is received at 13,200 volts from which, for power purposes, it is stepped down to 575 volts. For this purpose, three 225 k.v.a. transformers are used, these being located in the basement of the engine room. The switchboard is placed in the northwest corner of the engine room and is made up of nine marble panels. It is fitted with a duplex system of bus bars and switching apparatus so as to control the incoming Hydro current, the generator, the transformers and all outgoing feeder circuits for power and light. The result is that energy from either source of supply can be instantly distributed to any part of the plant for any purpose.

For lighting purposes both the generator and hydro current are transformed from 575 volts to 127-254 volts. All inside wiring is encased in conduit, while the outside lines are carried both on poles and underground in clay conduits. In the erecting and heavy machine tool bays of the locomotive shop where the operation of traveling cranes necessitates the placing of lamps at a considerable distance from the floor, flaming arc lamps with reflectors have been installed. Other buildings including the light machine tool bay, the power house, car shops and the older buildings are lighted by incandescent tungstens of various capacities. In all, about fifty flaming arc lamps are in use.

**Heating Plant.**

The heating of the plant is done from the central power station through the medium of the indirect hot air system. As before stated, the company develop their own power only as a by product of the heating plant. For the locomotive shop, the exhaust steam is delivered through a tunnel to the fan room on the east side of the building. Here it is condensed in cast iron "Vento" radiators. The air to be heated is drawn through these coils by means of a steam engine driving a "Sirocco" blower. The heated air is forced through both underground concrete ducts and overhead sheet metal pipes, and is systematically distributed throughout the building so as to produce as even a temperature as possible and, at the same time, the hot air does not blow directly upon the workmen.



ENGINE ROOM WITH AIR COMPRESSOR IN FOREGROUND

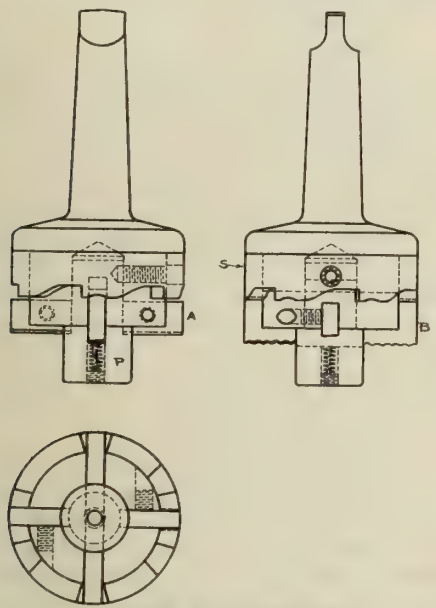
# PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

## A FACING TOOL DESIGN.

By A. L. Loy.

FOR facing off the ends of flywheels hubs in a boring mill equipped with a centre boring head, the accompanying tool was designed. It was provided with a No. 5 Morse taper shank



FACING TOOL DESIGN.

and was driven by a tapered key through the latter but which is not shown in the drawing. The finishing cutters, AA, were held solidly in the body by means of headless set screws, and projected out to the full diameter of the body, also into the pilot P, acting as drivers for same. This pilot was 2 in. in diameter, but turned down to 1½ in. where it entered the body. It was held in place by the headless set screw at the top which could be reached through a hole in the sleeve, S.

The sleeve was coarse knurled on the outer surface ½ in. thick, and had six stepped cams cut on the lower edge, these having a total movement of 5/16 in. It was of mild steel, casehardened and ground in the centre. These cams operated the roughing tool B, which passed entirely through both the tool body and the pilot. This tool was pressed up against the cam by the heavy spring in the lower end of the pilot, being held in by the short screw in the bottom of same.

The roughing tool was turned down at the ends so that the centre portion projected up into the knurled sleeve, thus preventing the tool from sliding or getting out of its proper position. Teeth were ground in the cutting edge to break up the scale, the teeth on the one side cutting down the ridges left by the hollows on the opposite side. The cutting edge of the rougher was 3/16 in. below that of the finisher when in the cutting position, and ⅛ in. above, when in the highest. When the tool was rotating it was only necessary to grasp the sleeve S which would cause it to rotate with respect to the body, thus putting the tool B in either the cutting or the clearance position. A slight depression was cut in the high part of the cam so that the operator could easily tell by the "feel" when the tool dropped into this. To remove the rougher it was only necessary to turn the cam ring to the clearance position and then pull the cutter down and out.

The finishing cutters were ground directly in the body, the pilot being removed for this operation. Chip grooves were also cut in the pilot but are not shown. Should the roughing tool have been ground off sufficiently as to demand any adjustment in the relative positions of it and the finishing cutters, this was easily taken care of by slipping a sheet metal ring of the proper thickness on top of the sleeve S, thereby bringing the cutter B down a corresponding amount. As this tool does not operate at a high rotative speed it is very easily handled and the particular tool in the cutting position is easily determined after becoming familiar with it. It is quite a time saver, it being unnecessary to stop the spindle as ordinarily to remove one cutter and insert another.

## A CONVENIENT DRAWING TABLE

By D. S. Mann.

THERE is perhaps no labor that is more trying than continuous drafting, necessitating, as it often does, a cramped and uncomfortable position for hours at a time. Any arrangements tending to a more comfortable position of the

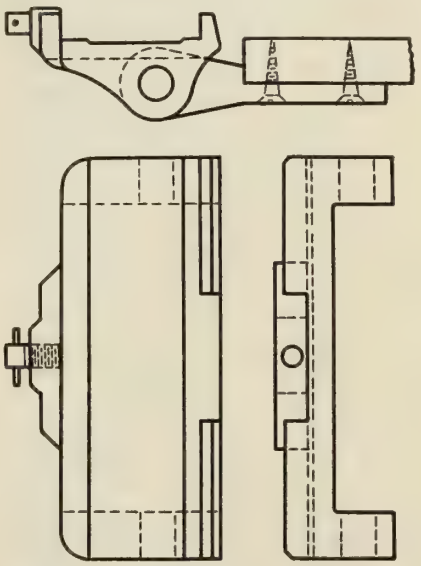


FIG. 2. DEVICE FOR HOLDING TEE SQUARE.

operator and thereby conserving his natural resources and nerve energy will be greatly appreciated and will bear fruit in an increased amount of work produced. The accompanying sketch shows

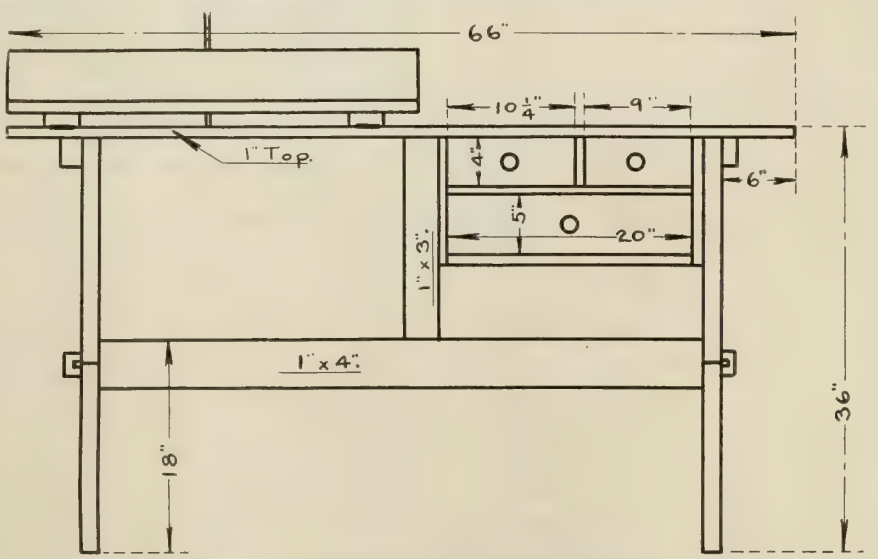

FIG. 1. CONVENIENT DRAWING TABLE.

a table used in the tool drafting department of a large concern which worked out very satisfactorily and which was

well received by the draftsmen using same.

The frame of the table was made of oak while the top was of pine so that the entire surface could be used for laying out extremely large work. This, however, rarely occurred and the ordinary arrangement was as shown. The regular drawing board was placed at the left of the table and hinged at the front, the back being supported by a flat strip

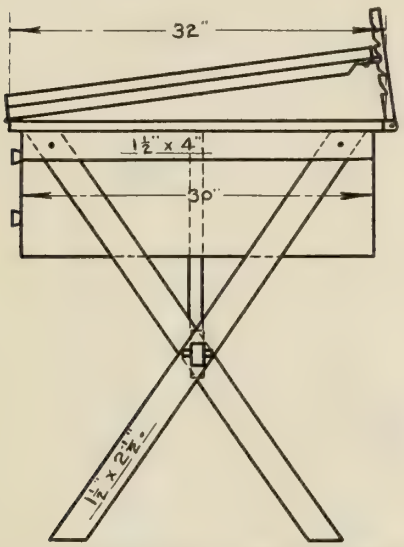

FIG. 3. CONVENIENT DRAWING TABLE.

of heavy steel in which notches had been cut, allowing for various positions of the board as regards height. The drawers at the right were large and of the full depth of the table giving good space for the storage of tools and books; anyone familiar with the ordinary type of table will readily appreciate this feature. The table space at the right was available for the use of drawings and prints which would otherwise be stacked on the drawing board proper.

In Fig. 2 is shown the device for holding the T-square. The head of the regular T-square was laid in this and clamped in place by the thumb screw at the back. This casting had two projections at the bottom, one under either end, which were reamed out ¾ in., allowing it to slide on a bar of cold drawn steel held to the board at the ends as shown. Keeping the rod slightly oiled allowed the T-square to be moved back and forth with little effort and it always remained in its proper position without any extra effort on the part of the operator. The square could also be tipped up vertically should it be desired to have the board entirely clear. The ¾ in. rod was somewhat lower than the surface of the table so that the square could be used against the edge of the board without interference, if desired.

Of course, it was impossible to bring the edges of the square entirely to either the front or back of the board, but this was seldom necessary, as the ordinary sizes of paper used were considerably less than that of the board and, should it be absolutely necessary to use the entire board surface, the brackets at the end were low enough so that the square would readily pass over them when used in the ordinary way.

## ONTARIO WORKMEN'S COMPENSATION ACT RATES.

PROBABLY the most important action taken by the Workmen's Compensation Board of the Province of Ontario, since it came into power, has been the striking of rates for the taxing of employers. Notices have been sent out to the employers throughout the province advising them of the charges they will have to meet in connection with the Compensation Act. While the figures have been made as accurate as possible for the present, the board may find that by the end of 1915 some of the assessments will have to be increased and others lowered. Acting on the advice of F. S. Hinsdale, and guided by his experience, the Compensation Commission has struck rates which the chairman believes will not be too hard on the employers, and yet will suffice to operate the Act.

### Rate Comparisons.

A noticeable feature of the Ontario Act is that the rates are lower than those of New York, Washington and Michigan, and in many respects lower than those of Ohio and Oregon.

The rates levied by the board are from one-half to two and three per cent. of the employers' payroll. The assessments are payable within fifteen days following the issue of the notices, but, in view of present financial conditions, the commission allow employers to pay one-half in that time and the balance at 6 per cent. on June 30, 1915.

### A Low Assessment.

The rate is surprisingly low in several of the factory classes. In the clothing trade, the assessment on cloth manufacturing and closely related industries is only one-half of one per cent. of the payroll. Clothing, shirt, cap manufacturing is considered less dangerous, and employers will only have to pay .4 per cent. on the dollar. The statement sent out shows that the lumber and kindred industries are charged about two per cent., several branches of the lumber industry being grouped with the one assessment. Foundries are taxed from 1.80 to 2 per cent., according to the kind of work. The printing industry pays only one-half of one per cent.

### Building Trades.

For the coming year, building trades will be charged around 2½ per cent. Structural steel working, structural carpentry, bricklaying, stone masonry and erection of concrete walls, etc., are included under this class. Lathing and plastering will be charged a rate of 2 per cent., while employers of painters will pay 2 per cent. of the payroll for outside work and 1.20 for inside work. Sheet metal work entails an assessment of 2½ per cent.

In connection with the building industry and the extent to which it will cover employment, there has been no definite statement except that of the Act itself. The Compensation Act covers every employment where that employment is made a part of the employer's business, which means that the man who builds a house to sell even if he employs but one carpenter, painter, or one or two bricklayers, must pay an assessement on their wages. The man who employs a carpenter or painter off and on at work about his own house or houses will not be called upon for a contribution. Whether the man who builds a house for himself, and does not intend to sell it, will have to pay an assessment has yet to be finally determined, but it is not considered that employment under such circumstances comes under the Act.

### Assessment Collection.

It is not anticipated that the board will have much trouble in collecting assessments. The Act provides for such cases in two ways. The board is given power to levy an additional percentage upon an employer for default in payment, and may also collect through the courts by the simple process of issuing a certificate, stating the amount due, a certified copy of which, when filled with the clerk of any district or country court, becomes an order of the court, and may be enforced as a judgment.

## INTERNAL STRESSES IN FORGINGS

H. V. WILLIE, of the Baldwin Locomotive Works, Philadelphia, has published particulars of a series of experiments conducted upon two 10 in. driving axles about 6 ft. long, for the purpose of determining the internal stresses in forgings after heat treatment. The axles were hollow bored with a 3 in. hole and were heated to 1500 deg., quenched in oil, and then immediately removed to an annealing furnace and annealed at 1200 deg. The object of these tests was to determine the magnitude of stresses in the axles due to heat treatment.

All conclusions derived from the experiments must be used conservatively, on account of the small number of tests. Nevertheless, it would appear that the heat treatment had a much greater effect upon a vertically quenched than upon a horizontally quenched axle.

# Series of Practical Questions and Answers for Mechanics

*Every care is being taken to include only pertinent, practical questions, and give same direct reliable answers. Catch questions will be avoided. Arithmetic, consisting of simple addition, subtraction, multiplication and division will be found a useful companion study.*

**Question.**—A slide valve is 10 inches long and 12 inches wide. The steam pressure is 120 pounds per sq. in. What size valve stem is required?

**Answer.** — Area of valve face is $10\times12=120$ sq. in.

Total pressure on valve is $120\times120=14{,}400$ pounds.

For iron to iron the co-efficient of friction is 0.15.

The power required to move the valve is, then, $14{,}400\times0.15=2{,}160$ pounds. By using a very low valve for the working stress; such as 3,000 pounds per sq. in., we may regard the valve stem simply as a rod in tension. Hence the area multiplied by the stress must be at least equal to 2,160. Area rod $=\frac{2{,}160}{3{,}000}$

Diameter $=\sqrt{\frac{2{,}160}{3{,}000\times.7854}}=\sqrt{.9167}$ $=.957$ inch, or, say, 1 inch in diameter.

* * *

**Question.**—What size cold-rolled steel shaft would be required to transmit 760 horse-power at 440 r.p.m., there being plenty of bearings and a number of heavy pulleys?

**Answer.**—A good approximate formula for this purpose is, $d=\sqrt[3]{\left(\frac{H.P.\times55}{r}\right)}$

where d = shaft diameter and r=revolutions per minute.

Diameter required $=\sqrt[3]{\left(\frac{760\times55}{440}\right)}$ $=\sqrt[3]{95}=4.56$.

* * *

**Question.**—A friction clutch contains a ring of oak which works against a flat cast iron surface. The outside diameter is 18 inches and the inside diameter 14 inches. The power to be transmitted is 42 horse-power at a speed of 220 r.p.m. What should be the pressure between the oak and the iron surfaces?

**Answer.**—The mean diameter of the friction ring is $\frac{18+14}{2}=16$ inches, or radius = 8 inches.

The number of foot pounds $=42\times33{,}000=1{,}386{,}000$.

Speed of friction surfaces = 220 r.p.m. or $\frac{16}{12}\times3.1416\times220=921.536$ feet per minute.

The rotative force required is $\frac{1{,}386{,}000}{921.536}$ $=1{,}503$ pounds.

The co-efficient of friction between oak and cast iron without lubrication is approximately 0.62.

The direct pressure required between the surfaces is $\frac{1{,}503\times100}{62}=2{,}424.2$ pounds.

* * *

**Question.**—A crane winding drum is 4½ feet long, 38 inches in diameter, and carries a double ¾-inch cable, which works over one double and one single block. How high could the load be lifted?

**Answer.**—The diameter of the drum is 38 inches. The mean diameter of one loop of cable is 38.75 inches. Circumference=$38.75\times3.1416=121.737$ ins.

Number of loops $=\frac{54}{2\times.75}=36$. The drum, then, will hold $\frac{121.737}{12}\times36=365.311$ feet.

There being four cables, the length of hoist is $\frac{365.311}{4}=91.3$ feet.

* * *

**Question.**—An aeronaut going at the rate of 90 miles per hour drops a bomb from a height of 3,000 feet. How long will the bomb require to reach the earth? How far behind the position vertically over the mark must he let go the bomb in order to hit it?

**Answer.**—The time required by a body to fall through a given height is equal to the square root of twice the height, divided by 32.16, or, time$=\sqrt{\frac{3{,}000\times2}{32.16}}$ $=\sqrt{186.567}=13.66$ seconds.

The bomb has a horizontal motion of 90 miles per hour $=\frac{5280\times90}{60\times60}=132$ feet per second. The distance travelled in 13.66 seconds is $13.66\times132=1{,}803.1$ feet.

* * *

**Question.**—What air pressure must be endured by a diver while working in 110 feet of water?

**Answer.**—A column of water a foot high and a square inch in cross section weighs $\frac{62.5}{12\times12}=.434$ pound. Pressure under 110 feet is $110\times.434=47.74$ pounds per sq. in.

This plus the atmospheric pressure = $47.74+14.7=62.44$, which is $\frac{62.44}{14.7}$ $=4.247$, or about 4¼ times the atmospheric pressure.

* * *

**Question.**—A steel band, 20 inches inside diameter is to be shrunk on a hub. .020 inch is allowed on the hub for shrinkage. To what temperature will the band have to be raised in order to enlarge the amount of the shrinkage? If the band be raised to a low red heat, what would be the difference in diameter between it and the hub?

**Answer.**—Co-efficient of expansion for steel is .00000599. For most accurate results the mean diameter of the band should be used. For our purposes we will use the inside diameter.

Circumference of 20-inch circle $20\times3.1416=62.832$. Circumference of circle, 20.02 inch in diameter is $20.02\times3.1416=62.8948$ inches. Expansion is $62.8948-62.832=.062832$ inches, which is $\frac{.062832}{62.832}$ $=.001$ of its whole length.

For every degree rise in temperature steel expands .000005.99 of its length. Temperature rise required then, is, $\frac{.001}{.000005.99}=166.9$ degrees, so that if the room temperature were 90 deg. F., the band should be heated to a temperature of $90+166.9=256.9$ degrees F.

Low red heat is about 975 deg. F., or a rise of $975-90=885$ deg. $885\times.000005.99=.00530115$. Expansion in circumference is $62.832\times.00530115=.33308$ inch.

Expansion in diameter $=\frac{.33308}{3.1416}=.10602$ inch.

Difference in size $=.10602-.02=.08602$ inch.

**Winnipeg, Man.**—Hon. Robert Rogers announced just before leaving for the east last Thursday night that the Dominion Government had been instructed by the Russian Government to purchase for them in Canada 20,000 saddles at $72.50 each. This order will be divided among the saddle manufacturers of Canada.

# PROGRESS IN NEW EQUIPMENT

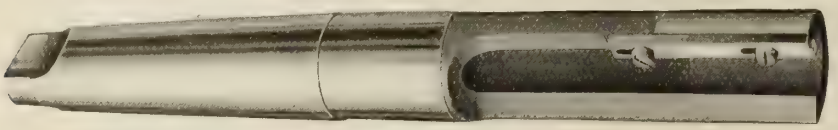
## A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

### NEW CHASER GRINDER.

THE chaser grinder illustrated herewith has recently been perfected by the Landis Machine Co., Waynesboro, Pa., to meet the demands and requirements of the many users of thread-cutting dies, and more especially the well-known Landis die manufactured by the above company. The machine is of a duplex nature, in that it is fitted with an attachment for handling all sizes of Landis chasers, and a device to sharpen the disc cutters of roller pipe-cutting machines. It may also be used to grind lathe, planer, shaper, tools, etc.

The chaser grinding attachment has adjustment in both horizontal and vertical planes, with suitable graduations for controlling the lead and rake angles on Landis dies. Both the transverse and longitudinal feeds are in horizontal planes, a feature which insures very accurate grindings. A close inspection reveals the excellent design of the table which is gibbed at both slides and finished with an overhang to protect the guides from emery dust. The disc cutter grinding attachment is also adjustable vertically and horizontally and is operated by hand. An adjustable rest is likewise provided to facilitate the handling of miscellaneous tools.

The rigid construction, guarded wheels and the ease with which the machine may be operated are features worthy of note, and together with its universal adaptability make it a most desirable equipment for the tool room.



CORE DRILL.

### A NEW CORE DRILL.

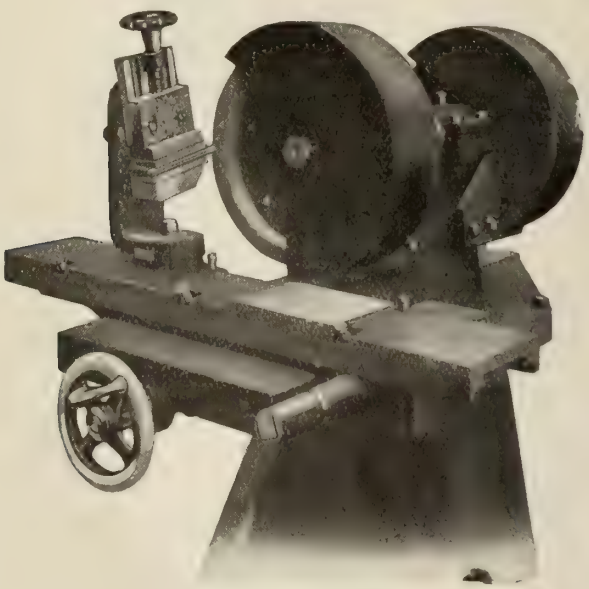
AMONG the small but very useful things about a testing plant will be a core drill recently brought out by the Triangular Tool Co., Erie, Pa. Nearly all manufacturers of steel and other metal products are required to take specimens from parts as designated by superintendents, owners and others. The getting of these specimens without a special appliance is altogether a costly and, in some cases, an impossible proceeding. There has not, we believe, been a thoroughly satisfactory tool for this purpose on the market, and any device that measures up to requirements should be well received.

The drill is shown in the accompanying illustration. It is made of high-grade steel and has a No. 5 Morse taper shank. Two cutters are furnished with each tool, each capable with a reasonable amount of care, of removing from 100 to 150 coupons, depending upon the material. The time required to core out a single piece is given as from 15 to 25 minutes, which operation can be finished complete without removing the drill from the hole. New cutters can be bought at reasonable cost, and the body of the tool used indefinitely. Other uses of the tool besides the taking of specimens for tensile and cross-bending tests, will no doubt suggest themselves to the resourceful mechanic.

### HIGH DUTY BALL-BEARING DRILLING MACHINE.

THE drilling machine shown in the accompanying illustration is known as the Avey No. 2½ High Duty Ball-bearing drilling machine, and is built by the Cincinnati Pulley Machinery Co., Cincinnati, Ohio. It is so designed that it may be operated full automatically, semi-automatically, or as a plain hand-feed machine. As a full automatic, the movements of the spindle are entirely under the control of the mechanism, and all that is required of the operator is to change the work under the spindle between strokes, operating as many spindles as the work will allow.

When arranged as a semi-automatic, all movements of the spindle except the engaging of the feed on the downward stroke are automatic. This is employed on work that requires a variable time for setting up. As soon as the work is fastened in position, the operator trips the feed lever, the hole is drilled, and the drill backs out of its own accord. The plain hand-feed is obtained by

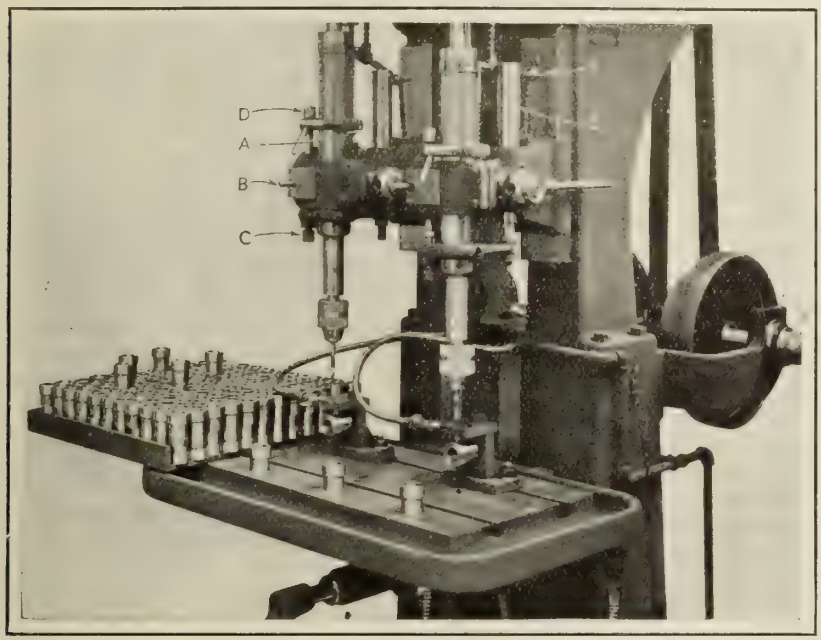


LANDIS CHASER GRINDER.

LANDIS CHASER GRINDER.

simply throwing out the automatic features. The hand lever is provided with a ratchet, which enables it to be placed in the most convenient position for operating, and can be instantly placed in the neutral position when it is desired to use the power feed.

The machine is entirely belt-driven, except the feed, which is driven by an enclosed worm. The pulleys, both on the spindle and on the countershaft, are extra large to give maximum pulling power, while the spindles are 1 inch diameter, and are ground to size. The spindle is finely graduated and fitted with a phosphor bronze stop collar, which serves as an accurate depth gauge. Four spindle speeds are obtained by shifting the countershaft cone, which is locked in each position by a ball plunger. The table elevating device consists of a double telescopic screw working against a ball thrust bearing and operated by a crank conveniently located. A steel rack is fitted between shoulders on the spindle sleeve for feeding and returning the drill.



NEW AUTOMATIC FEED DRILLING MACHINE.

The machine is fitted complete with ball-bearings. These are of the annular type, and are of standard sizes that may be purchased of all supply houses at competitive prices. Thrust bearings are also provided at both ends of the spindle sleeve. All are fitted with approved dust-proofing devices, which, along with the facilities for repairs, should give these machines a long life and low operating cost.

In the illustration, B is the lever for shifting the feed clutch by hand; D the adjustable tripping finger which regulates the depth of hole; C the lower tripping finger, which may be set to re-engage the feed clutch when the spindle returns; and A is the adjustable stop collar. At E is an air cylinder for the purpose of regulating and preventing jar to the returning spindle. This regulation is accomplished by means of the air relief cock at F.

These machines are furnished, if desired, with motor drive and lubricating tank and pump. They should cover a wide range of general manufacturing work, both in plants dealing with large and moderate quantities of component parts. This flexibility will allow of different jobs or various sizes of holes being drilled simultaneously on the multiple spindle machines, and they seem to be well suited both to the needs of piece and day workers.

## DOMINION STEEL CORPORATION.

AT the close of last year there were some indications of a possible shrinkage in trade and of a reduction in industrial activity in Canada. During the earlier months of this year these conditions were more or less marked, but the operations of the Dominion Iron & Steel Co., Ltd., were kept about the average by orders received from Australia and South Africa. Later there came the promise of a renewal of activity in the shape of large contracts for rails and other materials required for the construction of the great railways and public works in the various parts of the Dominion, and orders for lighter forms of steel for general consumption.

Work on these had only well begun when war was declared, and general disruption of business arrangements ensued. For a time operations were reduced to a minimum, and the outlook was most discouraging. Efforts were made to secure market in Great Britain for some portion of the company's output and these were fairly successful. Operations have been gradually increased and the working force is now about two-thirds of the normal.

The output of the principal products during the year is approximately as follows:

| | Tons. |
|---|---|
| Iron ore mined | 335,000 |
| Limestone quarried | 295,000 |
| Pig iron made | 181,000 |
| Steel ingots made | 237,500 |
| Rails made | 120,000 |
| Blooms & Billets for same | 23,500 |
| Wire rods made | 37,700 |
| Wire and wire products | 26,000 |
| Steel bars | 15,000 |

## NOVA SCOTIA STEEL & COAL CO.

THE business experience of the Nova Scotia Steel & Coal Co. for the year 1914, now closing, has been rather a checkered one, and perhaps in this respect differs but little from many other Canadian manufacturing establishments. The following figures indicate the output as compared with 1913:

| Product. | 1913. | 1914. |
|---|---|---|
| Pig iron made | 80,742 | 24,678 |
| Ingots made | 86,912 | 53,532 |
| Pig iron used | 72,204 | 43,649 |

The commercial depression which had overtaken Canada in the closing months of 1913, became very extended and deepened as the year 1914 progressed. Still the Scotia Company was able to keep all the furnaces in full operation until the outbreak of the war. It is true that the production of pig iron for the first half of the year was not as great as for the corresponding period of last year, but this was due to the blast furnace having been out for relining. The quantity of steel ingots made and pig iron used to produce them was greater than that of the corresponding period of 1913.

With the outbreak of war, in the early days of August, practically all business for a time ceased, and as the Scotia Company was carrying a large tonnage of ingots, it was deemed prudent to close down the blast furnace, open-hearth steel furnaces, and coke-oven plant, and on August 9, the blast furnace was banked, the open-hearth department closed down and all except one battery of coke ovens put out.

The placing of orders by the railroads of Canada for equipment was spasmodic and small, for the first half of the year, and after August 1 was practically non-existent. Little business of any kind

was available either from the railroads, manufacturers, or elsewhere, and in consequence the mills of the Company were operated but a few days a week.

**Making Shrapnel Shells.**

About the middle of September a demand arose for steel for shrapnel shells. Fortunately the Company was in a position to supply this material. Exhaustive tests at the Dominion Arsenal and elsewhere established that Scotia steel was eminently suitable for and met, indeed more than met, all the requirements of the War Office. Since that time considerable quantities of shell material have been ordered. One open-hearth furnace has been working on this material continuously for some little time, being operated on cold pig of which a quantity remained on hand on the closing down of the furnace in early August.

Further orders have been received from the War Office for shell material, and the stock of suitable pig iron having been exhausted, the blast furnace was again burdened and put in blast on Monday, Dec. 28. A second open-hearth furnace has also been turned on to this material.

**Output 3,000 Shells a Day.**

The Company's New Glasgow forge was called on to produce forged shrapnel shell blanks. This was entirely new business, but native talent, energy and the experience gained in other forms of forging surmounted all the initial difficulties, and for weeks past the hydraulic presses have been turning out upwards of 3,000 shells a day. These are being shipped to engineering firms finishing the shells, at Montreal Sherbrooke, Toronto, Hamilton, Galt, etc. Up to the present time, something like 150,000 forged shell blanks have been delivered to the order of the Shell Committee and shipped to the various points named, also a corresponding number of steel shell discs forged from special high-carbon alloy steel. During the next three months the Company expect to supply about 400,000 more shell blanks and discs.

**Orders from Great Britain.**

Believing that opportunity offered for securing some export business, the Company dispatched one of its most energetic salesmen to Great Britain. His efforts resulted in securing orders for a very considerable tonnage of heavy marine forgings; indeed, the orders booked for this class of material within the last few weeks have been equal to the entire output of this class of work during the past twelve months. The securing of this work was due entirely to the Company having installed a hydraulic fluid compression plant at Sydney Mines, together with heavy hydraulic forging equipment at New Glasgow. This installation put the Scotia Company in the forefront of establishments of its kind in the Empire.

**Recognition by Lloyd's**

The product of the Scotia plant is recognized by Lloyd's as equal to the production of the best British or Continental forges, having met fully their specifications and tests. It would appear, therefore, as though a new market of considerable value has been opened up and promises well.

Owing to the closing of the German markets by the war, and the closing down of many blast furnaces in Britain due to uncertainty as to the future, coupled with utter stagnation of the iron trade in the United States, it became necessary early in August to close down the Wabana mines. While ore shipments abroad up to that time were almost on a par with the corresponding period of 1913, the shipments as a whole for 1914 are less than one-half of that of normal years. During the last few weeks some considerable tonnage of ore has been sold for delivery in Great Britain during the coming summer.

**Coal Output Falls Off.**

Owing to the closing down of the blast furnaces and the open hearth plant, the colliery output was somewhat restricted during the last five months of the year, and as a result the output is about 100,000 tons below 1913.

The consumption of coal in the Company's operations was of course very much less; on the other hand, the shipments to the St. Lawrence were about 30,000 tons greater than during 1913; while the shipments to the Maritime markets were practically the same as the previous year. Banking of coal during the winter will probably be on a comparatively restricted scale as compared with former winters. It is too early to make any definite forecast as to the coal trade for 1915.

**Signs of Improvement.**

As to the iron and steel business generally, there are not wanting signs of improvement; more tonnage has been booked during the past few weeks than for months past, and although prices are exceedingly low, any tonnage available is eagerly welcomed.

Every effort possible is being made to keep the mills and forges of the Company in operation, one outstanding encouraging feature being that Canada is undoubtedly now getting an opportunity to supply large quantities of foodstuffs and many lines of manufactured material. Some of this new business will probably cease with the close of the war. On the other hand, new markets for Canadian products are being opened up which, if Canadian manufacturers rise to the measure of their opportunities, will, however, be permanently retained to the great advancement and material benefit of the Dominion.

## C. P. R. NORTH BAY DIVISIONAL SHOPS.

INSPECTION of the enlargement of the Canadian Pacific Railway Co. divisional shops at North Bay, Ont., shows how extensive the alterations and extensions are. Work on these was commenced early in 1913, and required about a year to complete. The project included not only the extension of the shops but also the mechanical yards, involving the reclamation of a small section of land along the shore of Lake Nipissing.

The motive power department prior to the change, consists of a 23 stall locomotive house, with small machine and blacksmith shop attached to the west end. This combined building was of heavy masonry construction, and has been retained in the new layout. To the west, however, there has been added a combined machine and erecting shop, served by a transfer table, along the west frontage of the shop. The erecting shop contains 10 tracks its depth being 70 feet. The normal monthly repair and overhaul output is eight locomotives.

## ELECTRO-PERCUSSIVE WELDING.

A PAPER on Electro-percussive Welding, by C. E. Skinner and L. W. Chubb, was presented at the twenty-six general meeting of the American Electro-Chemical Society, held on October 12 and 13, at Niagara Falls. The paper states that, in the process of electro-percussive welding, two wires are welded together by causing a condenser discharge to pass between the ends of the wires at the moment when they are pressed together by mechanical force. The generation of the heat is so localized, so sudden, and so intense, that there is no time for unequal heat conduction through the shanks of the wire, and the ends will be melted and even vaporized whether the melting point is high or low. For this reason, metals of different kinds can be welded together independent of their electrical resistance, melting point, or heat conductance.

Any combination of metals which has ever been tried will weld together, but the joints will not be permanent with such combinations as aluminium and tin, or lead and iron. Electrically, the weld is complete in 0.0012 second, and although 23 kilowatts are being dissipated between the ends of the wire at a certain instant, the total energy used at the weld is about 0.00000123 kilowatt-hour, or enough to light an ordinary 50-watt 16 candle-power lamp for 0.09 second.

## EMPLOYEES' WELFARE.

THE year just passed has been notable for the adoption throughout Canada of a number of Acts for workmen's protection and compensation in case of injury or death through accident in the course of their employment. Although these and similar legislation tend to make employees' welfare, to a certain extent, a legal necessity on the part of employers, the sphere in which the latter may show their personal consideration for their work people is not narrowed to any appreciable extent.

Much of the legislation referred to, notably the recently passed Province of Ontario Act, has been indirectly adopted from Germany and may yet require considerable amending before it will work smoothly under Canadian conditions. The objections so far urged come from the manufacturers, and are expressed in the matter of excessive and unequitable assessments. This difficulty has been partly overcome in New York State by a system of refunds, care being taken to so arrange the final assessment that the employer feels directly the result of extra effort in the care of the people in his employ. One aspect of employees' welfare work however, will be entirely changed by the present legislative enactments.

Steps taken and money invested in the preservation of the health of workmen and in reducing the hazard of their daily work have heretofore resulted in direct profit to the enterprising manufacturer. Provincial and national law will now make this a general condition attached to manufacturing and constructive business in Canada, and while the welfare of employees must, more than ever, be the result of personal thought and good-will on the part of their employers, it is not to be expected that as direct financial results will accrue to the latter as heretofore. There is, however, a vast field of activity in this direction open to the leaders of large corporations such as the provision of good homes, education, and the creation of healthy moral surroundings. These humanitarian branches of the employer's responsibility, while not yielding a financial profit, contribute immeasurably to the "holding" of workmen, the indirect importance of which has only recently been realized.

There have come to our notice several workman's benefit associations, but generally the only connection these societies have with the officials of the company organization is that the treasurer withholds from the pay envelopes each week or month the assessment for the benefit funds and which he turns over to the benefit society treasurer. The association is administered entirely by officials elected from among the employees and in some cases has been a far-reaching success. The greatest drawback, and in one instance the cause of failure has been the tendency of foremen to give the society little thought when hiring new help. Instead of taking on men more or less after the manner that insurance companies accept risks, they are inclined to hire those who may even be cheap on account of the lack of physical stamina. This eventually must tend to bring a heavy tax on the resources of the mutual benefit society. The most successful institution of this kind of which we have heard is that in which evidence of official interest is apparent by each member of the firm being assessed a monthly amount considerably in excess of that paid by the individual employees.

The welfare scheme that produces the best results and develops the greatest harmony between employers and employed is, and will always be the one that recognizes the personal element of good-will. Few managers realize that a Christmas present, if presented personally would be in every case worth many times more to both him who gives and him who receives, than if otherwise distributed. The director, shareholder or working official to-day who has not time to consider the welfare of his employees is like a mechanic who has no time to sharpen his tools, or the salesman who is too busy to brush his clothes.

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

Montreal, Que., Jan. 4, 1915.—On account of the holiday season there was but little activity in the iron and steel market throughout the week, the general dullness before prevailing having been accentuated by the festivities of the last ten days. As we cross the threshold of 1915, many factors present themselves from which the business trend of the first quarter of the year may be anticipated. On all sides we are hearing of the "boom" which is to follow the declaration of peace, and that such a "boom" is bound to come sometime in the future, no one for a moment questions. Peace, however, is not in sight and what concerns us most meantime is what the immediate future has in store. Toward the latter part of the year just completed, business conditions had commenced to improve. The lowest level appears to have been reached and we are now on the upward trend. We are at the moment of writing in the throes of a rather severe winter, during which season in any case the majority of our industries experience a slack period. Taken altogether, we are now passing over and leaving behind, the very worst possible combination of circumstances. As the year progresses, there is no doubt that improvements in all lines will be noted. In many industries, such as woolen mills, shoe factories, etc., great activity is being experienced; in fact, a great variety of industries are actively engaged in fulfilling orders for war supplies to the exclusion of other work.

### The Steel Market.

At present the greatest activity in the steel trade is in the manufacture of munitions of war. The manufacture of shells seems to be the main feature in many plants. Some firms have purchased new machines for rapid and economic production of this specialty, while others have re-arranged their equipment in order to facilitate the handling of such work. Most of the forgings for the shells are being made in Canada.

In the United States it is expected that the railway interests will be more or less extensive purchasers of steel, due to the adjustment of the freight rates

and improving business conditions. This activity will no doubt be reflected in the Canadian channels. Neither machinery steel nor structural sections are in demand. The new Armstrong-Whitworth Plant at Longueuil, P.Q., will put its various lines of product on the market during the winter..

### Pig Iron

Conditions surrounding the pig iron market have not changed. There is little or no business moving as the foundries are doing very little. Prices remain about the same because there is not enough business passing to test them.

### Machine Tools and Supplies.

Machine tools have not been the subject of much inquiry, while supplies have only been in moderate demand.

### Metals.

In the metal market business also has been quiet and prices have not changed.

---

**Toronto, Ont., Jan. 5, 1915.**—The past week has been, as is usual at this time of the year, a quiet one in business circles, and consequently there is nothing of particular interest to report. The dullness has perhaps been more pronounced than in previous years on account of aggravation by the war. While conditions generally are fundamentally sound, there is a continued tightness in the money market and a marked tendency to be cautious in business operations. There is some uncertainty as to industrial developments in the near future, although indications point to an improvement in trade by the spring. To what extent this optimism is justified remains to be seen. There is no doubt, however, that although the opening of the New Year finds trade generally quiet, except in the case of factories working on war orders, the outlook for the future is bright in Canada. There will be a continued restriction in the volume of trade for the next few months, but this will gradually become less noticeable as time goes on. The Government propose to continue operations on public works, but curtailment will be made in those of lesser importance, a necessary step on account of the falling off in revenue and the great expense entailed in furnishing equipment for the various overseas contingents.

### Steel Market.

Dullness prevails in the iron and steel trades at the commencement of the New Year. The dislocation in the steel trade, partly caused by the war, has not entirely been adjusted, although in some districts there are signs of revival in varying degrees. From Hamilton and Sidney come reports of increased business, which it is to be hoped will develop into something substantial. During last year the steel trade was in an unsatisfactory condition, partly due to the war, but principally owing to the industrial depression and the falling off in railway construction and in building operations. While ordinary trade conditions will, no doubt, improve before long, the same can hardly be said of railways and the building trade, because of financial considerations.

### Machine Tools.

Continued dullness prevails and conditions in the market are uninteresting. The present financial situation is no doubt responsible for this dullness, as a number of projects have been held up.

### Metals.

The metal markets are very dull this week, although some improvement may be expected now that the holiday season is over and industrial plants have resumed more active operations. Prices are unchanged all round, and there is a general quietness. The export copper situation is still unsatisfactory, large quantities consigned to neutral ports being still held up. The tin market is weak and unsettled. Spelter is firmer, and lead also continues firm with better inquiry. Aluminum is dull, but antimony is firm and developments are possible.

## C.P.R. FREIGHT TERMINAL AT QUEBEC.

BY the early spring of 1915, if all goes well, the Canadian Pacific Railway will have completed at Quebec, the work of construction which is being done by Downing-Cook under the direction of D. H. Mapes, supt. C. P. R. Building Construction, has progressed in a most satisfactory manner, and what was once only a section of the C. P. R. yards with its network of tracks has been transformed into the foundations and frame work of this proposed structure.

The foundations and floors of the two sheds, one for inbound freight and the other for outbound, are of reinforced concrete, while the structure itself is supported by steel rafters and girders. All foundations are on Raymond concrete piles. The inbound shed is 50 ft. wide by 600 ft. long, while that for goods outward measures 30 ft. wide by 300 ft. long. A transfer platform lies between both sheds, and tracks have been laid in such a manner that the freight cars may be shunted alongside both platform and shed. Another decided innovation, and one of much convenience to merchants, is the system of doors to be arranged. These sliding doors are continuous the full length of both track and roadway sides of the shed, and will be so installed and manipulated that an entrance to the shed may be effected at any particular point, therefore loading or unloading of goods will be greatly facilitated, and the time consumed lessened.

Both sheds or terminals are constructed on a system of units, that is to say, each shed will be so erected that, if necessity requires, it may be lengthened by the addition of further units. The structure will be absolutely fireproof and the cost of erection will amount to approximately a quarter of a million dollars. Some 115 men are employed at present; mostly local labor.

April 15 of next year is the date set for the completion of this contract, as it is the intention of the C.P.R. to erect a new station, the work on which will likely commence around that date, thus necessitating the demolishing of the old freight building on which site the erection of the new station is contemplated.

It is the intention of the railway people to have a freight terminal which will be modern in the strictest sense, therefore all the latest ideas of American and Canadian freight experts have been moulded together with that end in view. The structure will be fronted with a two-storey office building, 50 ft. by 100 ft., for the staff, and, through this, access to the sheds may be gained by those having business there. A complete installation of electric lighting and plenty of windows ensure excellent artificial and natural lighting. S. G. Newton is superintending the work in the interests of the W. S. Downing-Cook.

The terminals were designed by the building and construction dept., of the C. P. R. The steel work was planned by P. B. Motley, C. P. R. engineer of bridges. The steel used in construction will be furnished by the Dominion Bridge Co., of Lachine, and Douglass Bros., of Montreal, have the roofing and door contracts. The painting is in the hands of Schulmerich & Co., Montreal, and the brick work is to be cared for by the Citadel City Brick Co., of Quebec.

# TRADE AND COMMERCE RECORD

Dealing With the Steps Being Taken and Progress Made by Industrial Canada To Achieve and Maintain a Dominant Place in the Markets of the World

## BRITISH COLUMBIA AND THE PAN-PACIFIC EXHIBITION.

ACTIVE preparations are under way at the Provincial Agricultural Department for the exhibit which the British Columbia Government will make in conjunction with the Canadian Pacific Ry. at the Panama-Pacific Exposition to be opened at San Francisco on February 1. W. A. Laing, Exhibition Commissioner, will leave for San Francisco shortly to superintend the arrangements for the display, which will include exhibits illustrating the resources of British Columbia in minerals, timber, fish, fruit and general farm products, all of which being shown to the best advantage, will be bound to attract a great deal of attention and prove a magnificent advertisement for the Province. By combining with the railway company, a more effective display will be possible than by making a separate exhibit. Shipments are now being prepared and specimens of British Columbia lumber, fish, game, fruit and minerals will be forwarded before the end of the year.

The Government is sharing the large lecture room of the C. P. R., and a special feature of the exhibit will be the showing of a complete set of the cinematograph films taken during the past year for the Government, a few of which have been finished in Victoria, the remainder being sent to London to be developed and printed by the Kineto Co. to ensure the best possible results being secured. These films depict the following subjects:

Scenes illustrating the lumbering and salmon industries of the Coast, gill-net fishing, purse seine fishing, trap fishing, livestock at the colony farm, the departure of the first contingent for the front, the train of B. C. salmon donated to the Mother Country leaving Vancouver, vegetable growing at Armstrong, local, scenes, fruitgrowing and the B. C. Horse drilling.

These films, through the medium of J. H. Turner, Agent-General for the Province, will also be shown throughout Great Britain and other European countries.

## NEW U.S. FREIGHT RATES.

SCALES of rates to be used in making the general increase of 5 per cent. in class rates recently granted the Eastern Railroads by the Interstate Commerce Commission have been submitted to the Commission by C. C. McCain, chairman of the Trunk Line Association Committee.

To points intermediate between New York and Chicago, taking 71 per cent. and higher of the New York-Chicago class rates, the new tariffs will become effective on January 15 and, to points taking a lower percentage of the rates, they will become effective February 1.

The first-class rate between New York and Chicago will be 78.8 cents per hundred pounds, and the other five classes will be graded proportionately lower.

To Canadian destinations, the first-class rate from New York will range from 59.9 cents to 78.8 cents per hundred pounds, and it will be the same from Philadelphia and Baltimore. From Albany to Canadian points, the first-class rate will range from 44.1 cents to 63 cents, and from Syracuse and Rochester from 41.9 to 55.2 cents. The tariffs provide that from New York to all Canadian points, via People's Line steamers and rail via Rouse's Point, N. Y., not less than standard all-rail rates shall apply.

To points taking higher than 78 per cent. of the class rates on traffic moving by way of Long Island Sound, New London, Conn., or Boston or Portland, Me., a differential of eight cents per hundred

pounds lower than the standard all-rail rate is established with proportionately lower differentials on other classes.

## U.S. ARMS SHIPMENTS TO BELLIGERENTS.

IN response to Senator Hitchcock's resolution in the U.S. Senate, for information on shipments of war munitions from the United States, Secretary Redfield submitted on December 19, a report giving data so far available. There are 15,000 firms in the country, he said, that could export munitions, and it had been impossible to make a complete investigation.

Heaviest shipments of ammunition since the war began were in October, chiefly to the United Kingdom and France. For that month munition exports to them totalled $1,104,744 worth of cartridges, $539,360 worth of firearms and $1,114 worth of gun-powder. Since the war began there is no record of shipments of war munitions to Germany, Russia, Belgium or Servia.

Germany was a heavy buyer of cartridges and firearms in 1913, and a heavier buyer in 1914, but has taken none since the war began. Russia bought sparingly in 1913, the total value being less than $9,000, but in 1914 it rose to $750,000 worth of cartridges and firearms. She has taken none since the close of the fiscal year 1914 on July 1.

The United Kingdom took nearly $200,000 worth in the fiscal year ended June, 1913, and about $200,000 worth in the fiscal year ended June, 1914. She bought a little over $30,000 worth in August, nearly $300,000 worth in September and nearly $800,000 worth in October.

Canada was a heavier buyer. In the fiscal year ended June, 1913, Canada took $1,300,000 munitions of war, and the following fiscal year nearly $1,000,000. In August, after the war began, about $100,000; in September, about $80,000 worth, and in October about the same amount.

## ADDITIONS TO CONTRABAND LIST.

THE British Embassy at Washington made public on December 25 a complete list of the additions which Great Britain has made to her list of absolute contraband in the present war. This list contains many products never before reckoned as absolute contraband in any war, and will impose further restrictions upon American trade.

Great Britain's latest additions to the list of absolute contraband serve to emphasize more impressively than anything that has yet occurred her determination to throw overboard altogether the regulations of the Declaration of London in regard to the contraband. When the present war began she announced her intention of adhering as closely as possible to these declarations with a few exceptions. On her list of absolute contraband, as now made up, are many items not found in the Declaration of London.

Until the present war began, much headway had been made in the movement to restrict interference by belligerents with the trade of neutrals. The tendency seemed to be more and more to assert the principle that the rights of neutrals were to be protected. With the disregarding of the London Declaration it now seems to be the other way, and Great Britain apparently has started out to impose every restriction which will help to starve Germany into submission.

### Materials for Explosives.

The additions to the contraband list are chiefly materials that might enter into the manufacture of explosives. Partly-wrought copper and copper wire are added to the list, and also rubber, sulphur, glycerine and zinc and lead ores. Unwrought copper already was on the list of absolute contraband, but the copper items probably will hit the United States as hard as any. Here are the additions to the list:

Ingredients of explosives—namely, nitric acid, glycerine, acetone, calcium acetate and all other metallic acetates, sulphur, potassium nitrate, fractions of distilled products of coal tar between benzol and cresol inclusive; aniline, methyaniline, dimethylaniline, ammonium perchlorate, sodium perchlorate, sodium chlorate, barium chlorate, ammonium nitrate, cyanamide, potassium chlorate, calcium nitrate, mercury.

Resinous products, camphor and turpentine (oil and spirit).

Ferro alloys, including ferro-tungsten, ferro-molybdenum, ferro-manganese, ferro-vanadium, ferro-chrome.

Tungsten, molybdenum, vanadium, selenium, cobalt, manganese.

Wolframite, scheelite, molybdenite, manganese ore, zinc ore, lead ore, bauxite.

Alumina and salts of aluminum.

Antimony, together with sulphides and oxides of antimony.

Copper, part wrought, and copper wire.

Submarine sound-signalling apparatus.

Tires for motor vehicles and for cycles, together with articles or materials especially adapted for use in manufacture or repair of tires.

Rubber, including raw waste and reclaimed rubber, and goods made wholly of rubber.

The conditional list stands as before, but sulphur and glycerine are transferred to the absolute list.

## LONDON, ONT. HYDRO REPORT.

THE London Hydro Commission financial report for 1914, which has just been audited by Jewell & Dale, shows a splendid advance in earnings. In spite of the depression, the surplus at the end of 1914 operations is $72,789.11, being about double the surplus shown at the end of 1913, and this in spite of a 10 per cent. reduction in rates. The total revenue for 1914 was $269,851.80, as against $192.224.47. The profit on the year's operations in 1914 reaches $72,000 as against $45,000 for the previous year. The surplus would be sufficient to pay a 6 per cent. dividend on the common stock of a commercial company on a capitalization of $1,500,000, and still leave a surplus of $12,789.

### A 30 Per Cent. Reduction

The returns given from London are for the year ending November 30, 1914. London rates were cut 10 per cent. in 1913, and 10 per cent. in 1914. In the recent announcement of the Ontario Power Commission, another 10 per cent. reduction was ordered. This means that London rates have been cut 30 per cent. since that city started to use Hydro power. The rates of London are at least 25 per cent. lower than the prevailing rates in Toronto. If the 10 per cent. reduction ordered by the Provincial Commission had been put into effect in Toronto, the rates in London would still be at least 15 per cent. lower than those of Toronto. Hydro officials say that the London rates are the cheapest in the world.

In 1912 London paid $28 per horse power for Hydro; in 1913 the city paid $24 per horse power and in 1914 the rate was $23. London had 6,407 consumers in 1913 and in 1914 this number was increased to over 7,000.

An increase of nearly 1,000 consumers in a year proves that rate reductions get business, and that the advice of the Ontario Commission was safe and sound.

## MONTREAL CUSTOMS RETURNS.

A decrease of $6,473,099.29 was shown in the customs collections of the Port of Montreal for the present year, as compared with those of last year. While these figures are itemized finely, they have been estimated for the final three days of this year, but it is reckoned by R. S. White, Collector of Customs, that they are practically correct.

This is the first really big decrease in collections that has been shown by the Port of Montreal for many years. While the drop was steady, it showed a tendency to increase, the reduction during the past three months having been greater than during the earlier months of the year.

While the shrinkage in collections is very considerable, amounting to over $500,000 a month, it is not in itself a very serious thing, since it covers a large proportion of the trade of the Dominion. It really means that things have been thrown back to about where they were three years ago, when prosperity was in the air. The collections were about $5,000,000 less than those of 1912, and practically equal to those of 1911, while they were much in advance of the returns for previous years.

The reduction has naturally been attributed to the war, but it is stated that the present belligerent condition in Europe could not be altogether blamed for it, since the drop really began in the fall of 1913, long before anyone dreamed of the present troubles.

In July, 1913, Mr. White reported the greatest customs collections for any month ever taken in Montreal, amounting to $2,529,211. From that time the collections began to drop, until by November, 1913, they showed decreases from the monthly figures for 1912. During the present year they showed a steady tendency to shrink, until by August, the month in which war was declared, they

| Decrease in 1914 | | $6,473,099.29 |

*Estimated.

## ONTARIO MOTOR CAR TAX INCREASE.

ON December 30, the Hon. W. J. Hanna, Provincial Secretary, announced that the Ontario Government had decided to tax motor cars according to their horsepower. The license year of 1914 has been extended until January 31, 1915, in order to give the Provincial Secretary's Department time to get out the new schedule of rates. It is expected that the new license rates will provide an additional revenue of over $100,000. The revenue from motor licenses in 1914 was $149.210.45. The rate for motor vehicles announced by Mr. Hanna are as follows: 25-h.p. or less, $6.00; more than 25-h.p., and up to 35-h.p., $10.000; 35 to 50-h.p., $20.00; more than 50-h.p., $25.00; electric vehicles, $5.00, with the exception of trucks.

Commercial cars, used solely as such, and motor trucks having a carrying capacity of two tons and less, $5.00 a car with a charge of $3.00 a ton for all over two tons.

Motor cycles are left at the same rate as last year, $3.00.

If registration for a car be applied for between October 1 and December 31 of any year, the license fee will be cut down to half the rate, as the Department recognizes that it is not fair to charge a man the full fee when he can only use his car during the remaining three months of the year.

Manufacturers and dealers can have licenses for five cars for demonstration purposes at $25.00 and, for each additional set, a charge of $5 will be made. Five licenses for motor cycle dealers will cost $10.00.

### Determining Horse Power.

The new regulations provide that the Provincial Secretary may make special determination of the horse power of any motor vehicle for which registration is sought, but in general, and until otherwise determined, the horse power of gasoline automobiles will be fixed according to the formula adopted by the Association of Licensed Automobile Manufacturers, which is as follows:—Horse power equals bore squared, multiplied by number of cylinders divided by 2.5.

Despite the request of the motorists that the revenue from motor cars be "earmarked" and applied to good roads purposes, the new regulations make no provision for this.

## GRAND FALLS, NFLD. REPORT.

THE report of the directors of the Anglo-Newfoundland Development Co., recently issued contains the financial statements for the year ending August 31, 1914. After making allowance for depreciation, the profits of the year are reckoned at £71,166 1s. 8d., as compared with £65,054 in 1913, and £51,233 in 1912. £10,000 of this is used to purchase debenture stock for cancellation, while other amounts are used to pay interest on debentures and for the sinking fund, leaving a balance of £36,288 7s. 6d. to be added to the credit balance of last year, and making a total of £81,476 14s. 2d.

The output of the mill during the past year has been very satisfactory, and the quality of the paper and pulp has not only been maintained but improved. Considerable sums have been spent in effecting improvements, and the company has acquired the remaining water and timber rights in the watershed of the Exploits Valley above Grand Falls, including an area of 250 square miles of very valuable pulp timber lands. The company gave $5,000 to the Sealing Disaster Fund, and is also making up loss in pay of their employees who joined the Newfoundland Contingent.

## HYDRO-ELECTRIC RATES.

THE Ontario Hydro Commission have ordered a reduction in rates in every muncipality except Toronto. The reduction will save the light and power consumers $200,000 per annum in addition to the $150.000 per annum, saved by the 1913 reduction.

Successful has been the operation throughout the province of the people's Hydro-Electric enterprise. Notwithstanding that a year ago the Commission ordered a substantial reduction, the time was found to be ripe for a further cut. The principle of the Commission that low rates mean more business has been strikingly exemplified by the profits of the different municipalities in the power zone with their large capitalization of $11,000,000.

Under the policy of municipal ownership, all profits go back into the pockets of the consumer except in Toronto. Elsewhere the people are reaping the advantages of that policy, the reduction, it is estimated, meaning a saving to consumers of from 12 to 15 per cent. Port Arthur will get the highest cut with a reduction of 25 per cent. That city, London and St. Thomas will have the lowest rate for domestic and commercial lighting in the province.

Other reductions are:—Georgetown and New Hamburg, 20 per cent., Tillsonburg 18, Dundas, Galt, Guelph, Midland and Mimico 17 per cent., Milton, Rockwood and Thamesford 15 per cent., and Baden, Collingwood, Elmira, Hespeler, Ingersoll, Port Credit, Preston, St. Mary's, Stratford and Waterdown, 15 per cent. Fifty-five municipalities get reductions of over 10 and under 20 per cent., while fourteen get a 10 per cent. reduction.

### A Great Advance.

The total hydro power consumption is 79,000, of which Toronto's share where there are 32,000 consumers, is 27,000 horse power. Forty municipalities were operating when the reduction was made last year. Seventy-two had plants three months ago, and there will be 90 before the end of the year.

The principal reduction is in the charge for floor space, which goes down from 4c. to 3c. per 100 feet, with a minimum of 1,000 and a maximum of 3,000 square feet. Another feature of the new schedule is the addition of a second rate for domestic consumers to encourage the general use of cooking, laundry and other appliances which will stimulate Hydro consumption. This rate will be 50 per cent. of the initial rate.

"We hope by this to encourage greater use of electrical power in the homes of the people, for toasters, stoves, irons, vacuum cleaners, and such appliances," explained Sir Adam. "Of course, it also means that the man who likes to have his house lighted more than usual gets the benefit of a lower rate on excess lighting."

Still another change is in the rates for current not used for lighting purposes. This will mean a reduction of 50 per cent. for small house owners on current in excess of 40 kilowatts, and for large householders whose consumption is over 100 kilowatts.

### Basis of Rates.

Following is the basis of the new charges: — For incorporated villages, police villages and rural municipalities, 3 cents per 100 square feet of floor area per month, with minimum floor area charge for 1,200 square feet, and maximum floor area charge for 3,000 square feet. For urban districts outside the municipalities, 3 cents per 100 square feet of floor area with minimum floor area charge per month for 1,500 square feet and maximum floor area charge per month for 3,000 square feet. For cities and towns, 3 cents per 100 square feet of floor area per month, with minimum floor area charge for 1,000 square feet and maximum floor area charge for 3,000 square feet.a

### Commercial Rates.

The new commercial rates, with a prompt payment discount of ten per cent. in each case, are:

| | First 30 hrs. | Next 70 hrs. | Over 100 hrs. |
|---|---|---|---|
| Acton | 10 | 5 | 1.0 |

## EUROPEAN ORDERS FOR UNITED STATES.

THE nations of Europe have placed contracts in the United States for more than $300,000,000 worth of supplies since the beginning of the war, according to Charles M. Schwab, president of the Bethlehem Steel Corporation, who arrived in New York from Britain on December 24. Mr. Schwab predicted that for this reason the United States was now at the threshold of the "greatest period of prosperity it has seen in many years."

Mr. Schwab, who sailed for Britain less than a month ago, admitted that the object of his trip was to cancel provisional contracts he had made with the British Government for the building of submarines. This he had done, he said, after having been advised by the Secretary of State Bryan that for an American concern to supply submarines to any of the belligerent nations would be a violation both in the letter and spirit of the neutrality of the United States.

The contracts given up, he said, were worth more than $15,000,000, but he had been able to secure while abroad contracts for the supply of various other munitions of war, although he declined to say with what nation they had been negotiated.

"The next big problem that the United States will have to face," said Mr. Schwab, "will be the development of transportation facilities in order to handle the tremendous increase in manufacturing and commercial enterprises.

## GRAND TRUNK PACIFIC RAILWAY IN 1914.

DURING the year 1914, the work of grading on the Grand Trunk Pacific Railroad was practically confined to the main line, and even this was completed by the spring of the year. Track-laying was continued on the main line and several of the branches. In all about 190 miles of track were laid during the year, exclusive of second track, sidings, ballast pits, etc. A short re-survey of a portion of the Wattsview Boundary Branch was also made.

### Main Line.

The entire grade was completed the early part of the year, and track was laid westerly from mile 1265 to mile 1374. On April 7, this made connection with the track laid easterly from mile 324 east of Prince Rupert to mile 372. The entire line was also ballasted, and is in operation throughout. The grading for Prince Rupert terminals has been practically completed, and the construction of roundhouse and divisional point facilities are presently under way at Prince George, Endako, Smithers and Pacific. The divisional point at McBride has also been installed with very modern equipment. This completes the terminals on the line with the exception of Prince Rupert, for which immediate plans are under construction. Fuel oil facilities in lieu of coal are being prepared for at the divisional points in British Columbia. The following steel bridges were also completed during the year:

### Bridges.

Little Shuswap Crossing, mile 1101, consisting of one span.

3rd Crossing Fraser River, mile 1231, 950 feet.

Willow River, Mile 1262—450 feet.

4th Crossing Fraser River at Prince George (combination railway and highway bridge)—2650 feet.

Mud River, mile 1292—160 feet.

Upper Nechaco Crossing, mile 1373—675 feet.

Endako River Crossing, mile 1386, consisting of one span.

Endako River Crossing, mile 1403, consisting of one span.

Bulkley River Crossing, mile 1481, consisting of one span.

Bulkley River Crossing, mile 1486—350 feet.

Twelve bridges, each consisting of one span over fast mountain streams running into the Skeena River east of Prince Rupert, were also completed.

### Branch Lines

Harte-Brandon Branch — Length 25 miles. No work done on this branch during the year. The grading is completed to mile 21.85. The substructure for the steel bridge consisting of two spans (450 ft.) was completed, but steel not yet erected, although on the ground.

Talmage-Weyburn Branch—Length 15 miles. Track was laid on this branch during the year and the branch put in operation.

Prince Albert Branch—Length 111.5 miles. Grade is completed throughout this branch and the tracklaying to mile 87.2, this being at the southern approach to the bridge over the South Saskatchewan River. This bridge will be 1200 ft. long and will consist of 6 spans. The substructure has just recently been completed ready for erection of steel. The branch is in operation to mile 87.2

Cut Knife Branch—Length 50 miles. Tracklaying was completed on this branch from mile 33 during the year. The line is in operation from mile 0 to 33.

Moose Jaw Northwest Branch—Length 67.68 miles. This branch is completed for 67 miles north-west of the city of Moose Jaw and is in operation. A steel under-crossing with the Canadian Pacific Railway at the western boundary of that city was built during the year.

# INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

## Engineering

**Cobourg, Ont.**—The by-law for a proposed bolt and nut factory carried by a large majority on Jan. 4.

**Welland, Ont.**—M. Beatty & Sons have received an order for a considerable quantity of shells for the British War Office.

**Kingston, Ont.**—The Kingston Locomotive Works has received orders to manufacture more shrapnel shells for the British War Office.

**Peterborough, Ont.**—It is proposed to spend $20,000 on an auxiliary steam pumping plant. Wm. Kennedy, Jr., of Montreal, is the engineer.

**Montreal, Que.**—The C. N. & Q. have obtained a permit to erect an engine house and machine shop, one storey, 120 x 80 ft., at an estimated cost of $4,500.

**Montreal, Que.**—The General Canning Co. contemplate erecting a new plant at an estimated cost of $3,000. Canning machinery and power plant equipment will be required.

**Rocky Mountain, Alta.**—J. J. Lundy is negotiating for the installation of an electric lighting system for the village. Mr. Lundy will meet the new council early in the year to submit his proposition.

**Toronto, Ont.**—Fifteen armoured motor cars are being constructed by the Russell Motor Car Co. The total cost of these cars with equipment will be $100,000, which is being donated by J. C. Eaton of this city.

**Beaverton, Ont.**—A by-law to authorize a loan of $6,000 to George Minorgin & Son of the Beaverton Foundry was carried here last Monday by almost unanimous vote. In addition to their present business, Minorgin & Son will manufacture an extensive line of toys and other goods.

## Municipal

**Milton, Ont**—The shoe factory by-law carried.

**Newmarket, Ont.**—The by-law to raise $$15,000 for a hydro-electric system was defeated here on Jan. 4.

**Salmon Arm, B.C.**—A by-law will be voted on to raise $2,500 for the purchase of fire-fighting equipment.

**Berlin, Ont.**—The by-law to purchase an incinerator at a cost of $14,000 was carried by a majority of 156.

**Welland, Ont.**—A by-law to authorize the expenditure of $5,000 on a fire alarm system was carried last Monday.

**Arnprior, Ont.**—The by-law passed to exempt Arnprior Felt Co. from certain taxes and free water for five years.

**Chatham, Ont.**—The electors passed a by-law to grant financial assistance to the Everlasting Casket and Vault Co., a new concern.

**Brantford, Ont.**—Ratepayers endorsed a by-law calling for the expenditure of $100,000 to complete the local waterworks system.

**Aurora, Ont.**—The by-law authorizing the raising of $8,000 by debentures for the waterworks system was passed by a vote of 341-42.

**Sarnia, Ont.**—The ratepayers last Monday defeated by a vote of 927 to 157 a by-law calling for the expenditure of $60,000 on a city hall.

**Weston, Ont.**—The by-law to raise $6,000 by debentures to purchase the site for the waterworks was carried by a big majority here on Jan. 4.

**St. Catharines, Ont.**—Fire Chief Early in his annual report to the council recommends the purchase of an automobile combination chemical and hose truck.

**Toronto, Ont.**—By-laws were passed on January 1 to authorize the purchase of the Scarboro Division of the York Radial Co., and also for extensions to civic car lines.

**Brampton, Ont.**—The by-law to exempt the Williams shoe factory extension from taxes other than school and local improvements failed to get sufficient votes to pass it.

**Regina, Sask.**—The city waterworks department are preparing plans for extensions to the water supply system. R. O. Wynn-Roberts, consulting engineer, has the work in hand.

**Essex, Ont.**—Two by-laws were carried on Monday, one to grant concessions to the Essex Canning and Preserving Co., and the other to authorize the expenditure of $6,500 on waterworks improvements.

**Kingston, Ont.**—Two by-laws, one to permit J. M. Campbell to erect poles and wires on the streets, and the other to construct a railway siding on Ontario street for the benefit of a number of industries, were carried.

**Bracebridge, Ont.**—By-law to guarantee a bond for $20,000 in connection with the establishment of a linen industry was carried, also a by-law to raise debentures for the development of High Falls for electric power purposes.

**Ottawa, Ont.**—The Provincial Board of Health have decided to investigate the Curry-McVeity Ottawa river filtration plans. The Board have already refused to approve of the plans on the ground that the source of supply is not satisfactory.

**St. Catharines, Ont.**—Ratepayers of the village of Port Dalhousie last Monday carried a by-law to provide $50,000 by the issue of debentures for the introduction of a waterworks system, on a vote of 133 to 36. It is proposed that a supply of water be obtained from the St. Catharines system, and piped by a main to the new village system to be installed.

**Toronto, Ont.**—At Osgoode Hall on Dec. 24, Mr. Justice Middleton gave judgment for $14,760.21 in favor of Loomis, McBean and Williams against the City of Ottawa in connection with the intake pipe contract. He dismissed the city's claim for $25,000 damages and a penalty of $9,200. Judge Middleton held that the action of the city in discharging Engineer Currie and his refusal to certify dispensed with the necessity of any certificate from him as a condition precedent of the right of action.

## Electrical

**Berlin, Ont.**—The Kauffman Rubber Co. are in the market for electrical equipment.

**Berlin, Ont.**—The new scale of rates decided upon by the Hydro Commission was adopted by the Light Commission here on Dec. 30. The commercial rates were slightly reduced, but the power and street lighting rates remain the same as

in 1914. The net profit of the electric department for the year will be approximately $13,000.

**Toronto, Ont.**—The Toronto Hydro-Electric Commission has decided to comply with the order to reduce the rate, made by the Provincial body, in all but two requirements. These two rates to which the local Commission objects are for power, first alternating current, and second, direct current. It is declared that these rates affect principally the waterworks system. A conference between the two bodies is being sought.

**Toronto, Ont.**—The Hydro-Electric power by-laws, which were voted upon in eleven towns throughout the province, chiefly in the north-western district, on the new Eugenia Falls system, were, with one exception, successful. Newmarket defeated the Hydro policy by a majority of 109 votes. The following Hydro by-laws were carried:—Eugenia Falls system—Durham, Shelburne, Dundalk, Delaware, Mount Forest, Chatsworth, Huntsville. Niagara system—Lambeth, Bothwell.

**London, Ont.**—The Ontario Hydro-Electric Commission is placing a survey party in the field shortly, under Engineer Bucks, to collect information on tentative radial railway routes in the district north of London, Sarnia, Chatham and Stratford. A party under Mr. Stanley is now working on a survey between Guelph and Stratford. Chief Engineer F. A. Gaby states that for the purpose of preparing estimates, trial lines have been laid from Guelph northward through Fergus, Flesherton, Markdale to Owen Sound and Meaford; also from a junction point on this line just east of Arthur, through Arthur, Mount Forest, Hanover and Chesley to Owen Sound; also from Guelph through Milton and Port Credit to Toronto.

## General Industrial

**Lindsay, Ont.**—Horne Bros. contemplate rebuilding their woolen mill which was recently destroyed by fire.

**London, Ont.**—The De Luxe Specialty Co. will shortly begin the manufacture of cleaning compounds. William Brock is manager.

**Lethbridge, Alta.**—It is reported that the Cream of Wheat Products Co., of Minneapolis, Minn., may establish a plant at Lethbridge.

**Kincardine, Ont.**—At a special meeting of the Council held on Dec. 29, it was decided to loan William Mitchell the sum of $1,500 for the purpose of assisting him in establishing a woollen mill.

**Port Moody, B.C.**—It is reported that another oil industry in the shape of a refinery will be established in Port Moody in the near future. The Shell Oil Co. is said to be negotiating for a site. The company is a Californian one, with extensive oil holdings and with a branch office in Vancouver.

## Tenders

**Outremont, Que.**—The time stipulated for the reception of tenders for the construction of a school here, and which should have expired on Dec. 29, 1914, is extended until January 22. Copies of plans may be had at the office of J. A. Godin, architect, 269 St. Denis street, Montreal, where estimates may be seen.

**Toronto, Ont.**—Tenders will be received up to Tuesday, Feb. 2, 1915, for the supply and delivery to the Street Cleaning Department of 100 (more or less) loose paper can receptacles, as may be required. Specifications may be seen and form of tender obtained, together with all information relative thereto, at the office of the Street Cleaning Department, City Hall, Toronto.

**Toronto, Ont.**—Tenders will be received by the chairman of the Board of Control, up to Tuesday, February 16th, 1915, for supply and installation of furnaces and appurtenances for refuse incinerating plant. Specifications and tender form for the foregoing may be obtained upon application at the office of the Street Commissioner, Department of Street Cleaning, City Hall, Toronto.

**New Hamburg, Ont**—Tenders will be received up to Wednesday, Jan. 20, 1915, for the purchase of the real and personal property of the New Hamburg Manufacturing Co., Ltd. The plant is adapted for the manufacture of threshing machines, engines, cement mixers, etc. Full detailed particulars may be had on application to Charles J. Fox, New Hamburg, and Bissett & Peine, 24 Adelaide Street East, Toronto.

## Railways-Bridges

**Montreal, Que.**—It is proposed to build a tunnel under the Lachine Canal on Wellington street. The cost is estimated at $750,000 and $1,500 has been appropriated by the Board of Control for work on plans.

**Ottawa, Ont.**—According to Sir Donald Mann, the C. N. R. will not ask for further legislation this session. The only request, he states, will be for extension of time to build branch lines, work on which has had to be suspended owing to the war.

**St. John, N.B.**—A conference between Premier Clarke and F. P. Gutelius, general manager of the I. C. Railway on Dec. 22, arrangements were completed to open the St. John Valley Railway as a part of the Intercolonial System from the commencement of the new year. The construction company is operating the line at present.

**Pacific Great Eastern.**—D'Arcy Tate, vice-president of the Pacific Great Eastern Railway, reports that grading is rapidly being completed on the different sections of the Pacific Great Eastern Railway, between the end of the track, at the head of Anderson Lake, and Fort George. It is expected that rails will be laid to Lillooet, thirty-two miles beyond Anderson Lake, early in February. The track now extends eighty-seven miles from Squamish. Train service will probably be extended from Pemberton, the present terminus, fifty-seven miles from Squamish, to Anderson Lakes, by Jan. 1915. New schedules are now being prepared. It is planned to operate a daily service, except Sundays, each way with mixed trains.

**C. N. R. Desires Time Extensions.**—Notice has been given by the C. N. R. of applications to Parliament for time extensions for the construction of a large number of lines in Eastern and Western Canada. Among these are lines from Hawkesbury to a point in Leeds or Lanark, Washago to Kincardine Arnprior to Gananoque, Pembroke to Cobourg or Port Hope, Niagara River to Goderich, Berlin to St. Mary's and Woodstock and others in Ontario; Rawdon northerly to the N. T. R., with a branch to Joliette, and St. Jerome to St. Eustache in Quebec, and a large number in the West. The James Bay and Eastern Railway Co. and the Southern Central Pacific Railway Co. are also applying for time extensions.

**C.N.R. Appeal for Aid.**—Sir William Mackenzie and Vice-President D. B. Hanna, of the Canadian Northern, were in Ottawa on Dec. 29, and are understood to be placing a statement of their affairs with respect to the recent bond guarantee before the Government. The Canadian Northern, so far as can be learned, has been unable to realize on its securities owing to the war and the consequent disturbance of all financial arrangements. In the action taken by Parliament at the last regular session, the war situation was not contemplated, and the measures then adopted which made ample provisions for all requirements under normal conditions have not produced cash results except to a figure far below the amount of the guarantee. The present proposal seems to be that the Government assist the company to realize on the securities which they have.

# Personal

**George H. Webster,** a well-known civil engineer, formerly with the C. P. R., died in Vancouver, B. C., on Dec. 29.

**Col. A. C. Labelle and Farquhar Robertson,** Harbor Commissioners of Montreal, recently visited and inspected the harbor works at St. John, N.B.

**John C. Newman,** a director of Canada Steamship Lines and other important Montreal concerns, is again able to be at his office, after a severe illness.

**John Hasson Miller** died in Montreal on Dec. 29. Mr. Miller was born in Pittsburgh, Pa., in 1844, and came to Montreal in 1904 to join the staff of the Montreal Rolling Mills, from which company he retired a few years ago.

**E. V. Buchanan,** of the Public Utilities Commission, has been appointed to take full charge of its various departments which General Manager H. J. Glaubitz and Assistant Manager Hunt have been relieved of pending the judicial inquiry into the charges preferred against them.

**C. D. Howe,** Dominion Government engineer in charge of the work at the elevator, Saskatoon, Sask., will probably complete his work about the middle of January. Mr. Howe will go from there to Calgary or Vancouver, at both of which places elevators are to be built in the near future.

**L. S. Humes,** formerly local manager of the Great North-Western Telegraph Co. in Montreal, has been appointed district superintendent in connection with the taking over of the C. N. R. telegraph lines by the G. N.-W. Mr. Humes will have jurisdiction over all G. N.-W. offices in New Brunswick, Quebec and Ontario east of Kingston, with headquarters at Montreal.

# Trade Gossip

**The American Steam Pump Co., Battle Creek, Mich.,** have sent out a Christmas card to their friends. It is printed in two colors, and shows a view of the factory, under which is inscribed seasonable greetings.

**The Taylor Engineering Co.** of Vancouver, B.C., which was recently incorporated, will manufacture pumps and other power plant equipment. A. J. T. Taylor is the managing director, and the capitalization is $50,000.

**Montreal, Que.**—One of the biggest pieces of insurance business handled in Canada has fallen to the firm of Marsh and McLennan, inc., of London, New York and Montreal. This is the risk—about $15,000,000 — covering the Canadian Pacific steamships on both Atlantic and Pacific routes.

**The Ideal Incinerator & Contracting Co., Toronto,** have been awarded contract for civic incinerator for the City of Berlin, Ont. By-law was submitted to ratepayers on January 1, 1915, and passed. The company will begin work this month. Incinerator has capacity of 25 tons a day and, with extensions to be made, a capacity of 45 tons a day will be available.

**Toronto Board of Trade.**—The new quarters of the Board of Trade on the nineteenth and twentieth floors of the Royal Bank building were formally opened on Dec. 29 in the presence of a representative gathering of the members and their friends. The board, which was organized seventy years ago, has a membership of 2,500. Premier Hearst inaugurated the new quarters.

**Montreal, Que.**—The C. E. Deakin Co., one of the largest contracting firms in Canada, went into liquidation on Jan. 4, when a winding-up order was granted by Judge Charbonneau on the application of the Structural Steel Co. The Steel Company declared it was a creditor for $1,000, part of which was represented by a promissory note, which had been refused payment. E. A. Wright was appointed provisional liquidator.

**Montreal, Que.**—The White Star-Dominion Line has decided to merge the management of the Portland and Montreal offices, with John Torrance as manager and P. V. G. Mitchell as assistant manager, the appointments becoming effective January 1, 1915. The headquarters of the company will remain in Montreal. This reorganization is consequent on the death of Manager James Thom of Montreal, which occurred on November 26.

**Newcastle, N.B.**—Three-fourths of the New Brunswick pulp mill at Lower Derby, six miles from here, built six years ago, and doing a large business, was burned on January 1, leaving only the chemical and boiler plants. The damage, about $100,000, is well covered by insurance in some thirty companies. The mill, which generally employed 100 people, had been shut down since the middle of last May. The company will rebuild on the Miramichi, but whether at Millerton or Newcastle is uncertain.

**Montreal, Que.**—The Canadian railways are considering the raising of their freight rates on goods being exported to the United States by 5 per cent. This will correspond with the increase of 5 per cent. sanctioned by the Interstate Commerce Commission for all goods except coal and iron ore, exported from the United States into Canada. The latter increase will come into effect January 15, after ten days' notice has been given, but owing to the Dominion Railway Commission requiring 30 days' notice of any change, it is not anticipated that the Canadian roads will increase their charges until the middle of February.

# Catalogues

**Second-hand Machinery.**—We have received from Thos. Mitchell & Sons, Ltd., Bolton, Lancashire, England, a copy of stock catalogue No. 46, which contains a long list of new and second-hand engines, boilers, pumps, machine tools and contractors' plants, etc.

**The Hamilton Facing Mill Co., Ltd.,** Hamilton, Ont., are distributing among their friends an attractive calendar for 1915. It consists of a reproduction of the painting, "Scotland by the Sea," on a stiff white frame, mounted on a green background, the calendar being situated below the picture. Altogether it is quite an artistic production.

**Graphite Paint.**—The United States Graphite Co., Saginaw, Mich., has issued a booklet dealing with the properties and application of Mexican graphite paint. The booklet contains some useful information on graphite and graphite paint, with a number of comparative analyses of various brands. A feature of the booklet is the large number of excellent illustrations reproduced from photographs taken of buildings, bridges and other steel structures where the paint has been used. This is a handsome catalogue, having several artistic features, and being generally well gotten up.

**Hoists.**—The Wright Mfg. Co., Lisbon, Ohio, has issued catalogue No. 6, descriptive of the Wright standard chain hoists, one type being a triplex or spur geared, and the other a screw hoist. The construction of each type is described in detail, while a series of tables give the price of each size and the prices of the various parts. The illustrations show the various types of hoist and the parts used in their construction, the latter being numbered to correspond with the tables for convenience when ordering spare parts. Other products described include the "Wright" differential chain block, steel trolleys and hand travelling cranes.

**Steel Sash.**—An exceedingly attractive catalogue No. 8 has been issued by David Lupton's Sons Co., Philadelphia, Pa. The catalogue deals principally with the "Lupton" steel sash for factories, power houses, etc. A full description is given covering the construction of the

sash, accompanied by full-sized detailed drawings of the members. Other types dealt with include "Lupton" steel partition, steel tube doors and jambs, and "Pond" continuous sash and roof truss. Each type is described fully, and diagrams show the design and construction. The catalogue concludes with a detailed description of the "Pond" operating device, with illustrations showing its application under various conditions. The contents, which are fully illustrated, run to 84 pages. Many installations are included. The catalogue has attractive green covers, and cancels No. 7 and all previous specialty editions.

## Book Reviews

**Electrical Measurements**, by O. T. Bushnell and A. G. Turnbull, 165 pages, 8¼ x 5¼, 139 illustrations. Published by the American Technical Society, Chicago, Ill. Price, $1. This is a practical hand-book covering the design and construction of measuring instruments, also their uses in measurements of current, resistance, and commercial power, with special reference to watt-hour and maximum demand meters. The authors are in charge of the meter department of the Commonwealth Edison Co., and are, therefore, in daily contact with the problem of the measurement of electrical energy. They state that it has been their aim to give a practical presentation of the subject, and to give an adequate description of the instruments and methods used, and show by instructive wiring diagrams exactly how meters should be connected under all conditions for both direct and alternating currents. The enormous development in the uses of electric current and in commercial power has increased the necessity for accurate methods of measurement of electrical energy. This demand has resulted in the design and manufacture of accurate instruments for all purposes; standard methods of measurement and testing have also been established. Under these circumstances a volume such as this will be specially welcomed, as it is written from a practical viewpoint. It should have a wide field of usefulness among users of commercial power as well as among those who desire to increase their knowledge of electrical instruments. The text is classified under a series of subjects arranged as follows:—Merits of measurement, primary standards, electrical measuring instruments, methods of measurement, watt-hour meters, watt-hour meter records and measurement of maximum demand. The book is fully illustrated and shows clearly various types of apparatus and wiring diagrams. There is an alphabetical index in addition to the index of subjects.

**20 TIMES THE SERVICE**

That's what this self-hardening, high-speed steel chaser does for the LANDIS DIE. Four long cutters tangentially disposed to the work carried in suitable holders make an ideal cutting condition. This, along with its many other distinctive characteristics, has established for us a world-wide reputation.

# EXAMPLE AND COURAGE

We're not living in boom times. Everybody recognizes the seriousness of the situation. We all appreciate the value of courage in times of trial and that the force of example must not be lost sight of. Passive resistance is not good enough in war times. Aggression is a symbol of victory no less renowned in peace than in war.

Be courageous! You are fighting for a principle; for right and progression, not might and destruction. Then Advertise! Advertise! Advertise!

*A Valuable New Book on an Important Trade*

## PATTERN-MAKING

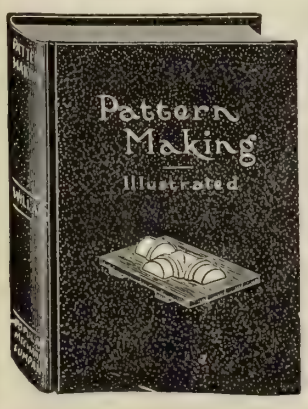
By G. H. WILLARD

**Two Significant Opinions:**

"I think the book is the best I ever saw for the price." Edwin Sluyter, Construction Engineer, Burroughs Adding Machine Co., Detroit.

"I consider this is a valuable book and should be in the hands of all men engaged in this line of business." E. W. Clarke, Wilmington Malleable Iron Co., Wilmington, Delaware.

224 Pages. 312 Illustrations. Cloth Cover.



**With Additional Chapters on Core-Making and Molding**

**"WRITTEN SO YOU CAN UNDERSTAND IT."**

A book for the man who does the work. Written by a practical patternmaker of many years' experience. Gets right down to business in the first chapter and keeps it up throughout the book. Full of kinks and actual working information. Profusely illustrated.

**Chapter Headings**

I. Pattern-Making as a Trade. II. The Tools. III. Woods. IV. Joints. V. Turning. VI. Turning (Continued). VII. Turning (Continued). VIII. Turning (Concluded). IX. The Circular Saw. X. The Circular Saw (Continued). XI. Machine Tools. XII. Machine Tools (Continued). XIII. Simple Patterns. XIV. Simple Patterns (Continued). XV. Simple Patterns (Concluded). XVI. Crooked Patterns. XVII. Large Pattern Work. XVIII. Large Pattern Work (Continued). XIX. Crosshead Guide Patterns. XX. Sweep Work. XXI. Pipe Work. XXII. Stove Pattern Work. XXIII. Molding—Machine Work. XXIV. Molding Pattern Work.

**Part II.—Core-Making and Molding.**

Chapter I. Core-Making, Simple and Complex. II. Principles in Molding. III. Loam Patterns and Loam Molds. Everyone following this trade, or intending to learn it, should have a copy of this valuable book.

**Price $1.10 Postpaid**

**Technical Book Department**
**The MacLean Publishing Company, Limited**
**143-153 University Ave., Toronto**

# YOU MAY FIGURE

MORSE AND

THAT YOU WANT A CHEAP TOOL THAT YOU CAN AFFORD TO SCRAP AFTER USING IT ONCE, BUT WHAT ASSURANCE HAVE YOU THAT THE SAME TASK MAY NOT COME AGAIN? SUPPOSE IT DOES AND YOU HAVE TO REPLACE THAT TOOL WHILE DOING THE WORK? ONE GOOD TOOL IS CERTAINLY CHEAPER THAN TWO POOR ONES, AND IT IS NOT THE TOOL THAT WILL DO ONE JOB WELL BUT THE TOOL THAT WILL CONTINUE TO DO THEM WELL THAT IS THE ECONOMICAL TOOL TO BUY.

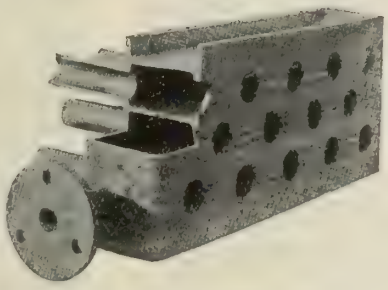
OXY-ACETYLENE WELDING and CUTTING PROCESS

No Shop, Foundry, Shipyard, Manufacture, Mill, Mine, Garage should be without it. A Money Saver. A Money Maker.

"Made in Canada" Goods.

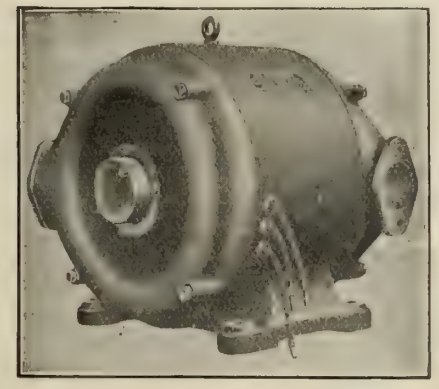


Apparatus made of I-Beams, welded, to stand high pressure.

L'AIR LIQUIDE SOCIETY
(Paid-up Capital $2,200,000.00)
26 Boler St. WEST TORONTO
Maisonneuve MONTREAL
325 William Ave. WINNIPEG
EVERYTHING in the OXY-ACETYLENE LINE

The Lancashire Dynamo & Motor Company, of Canada, Limited
107-109 Duke Street, TORONTO

ELECTRICAL MACHINERY for all Purposes.
ELLIOTT BROS'. { INSTRUMENTS / RECORDING GAUGES



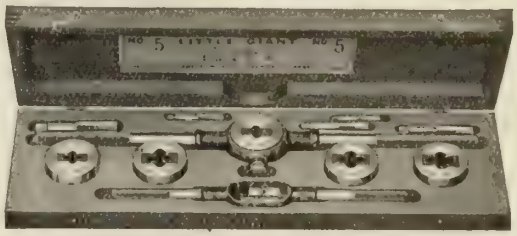
PIPE VENTILATED A C MOTOR
FOR VERY DIRTY PLACES

CONFIDENCE

There is nothing like the satisfaction a workman gets from *knowing* his tools are going to stand up to the work.

This confidence has been enjoyed for 30 odd years by the users of

Little Giant
Screw Plates



This assurance is stronger to-day because the experience of all these years has developed to their present state of perfection those keen-cutting, perfect-thread producers,

Little Giant TAPS AND Little Giant DIES

See the construction of the die — Better yet, see the tools.

# A Prosperous New Year

A THOUSAND wishes alone would not bring you success in 1915. Although we do sincerely wish you all prosperity in the New Year we are prepared and waiting to back up our wishes with a real and tangible service.

If you are a subscriber, let CANADIAN MACHINERY help you in 1915. If you are a buyer of Machine Tools, consult this directory and the advertising pages.

If you are a manufacturer of Machinery or a Dealer, we can help you to bigger business and a more lasting connection.

Is your name in this directory? If so, there is reasonable expectation that our wishes for your enjoying a prosperous year shall be fulfilled.

# THIS DIRECTORY IS FOR YOUR USE

IF you want the correct 'phone number, you use the official telephone directory. If you wish to definitely ascertain the location of a certain street, you consult a city directory.

If you are in need of equipment of any description, the best way to buy it is to consult our Buyers' Directory. If what you require isn't advertised in this particular issue, write to the firm or firms listed under the title of the machine you require, and catalog or literature will be gladly sent.

The firms listed in this Directory think enough of your business to ask for it, and they have unlimited confidence in the product they advertise.

Consult this Directory and you can't go wrong.

## Norton Alundum To Grind Plane Surfaces

The increasing number of surfacing operations performed by grinding wheels in place of former machining methods indicates the growing success with which wheel manufacturers are overcoming the difficulties of this broad-contact grinding.

The success of Alundum on steel and Crystolon on cast iron has been no small factor in the development of plane surface grinding.

## Dodge Steel-Split Pulleys

**This is something new—and admittedly the most perfect Steel-Split Pulley on the market.**

Rims ¼-in. steel cannot dent, bend or break.

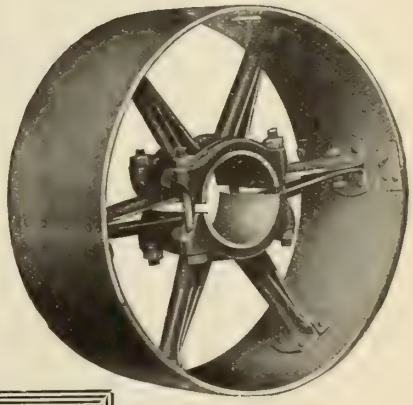
No grooves through centre to decrease belt adhesion. This seamless and beadless rim is strong and true running.

Made in both single and double arm.

Arms support rim on either side of parting.

**Order a sample pulley for comparison of quality and price.**

Full particulars in our "POWER TRANSMISSION ENGINEERING" CATALOG.



# Dodge Merit

## *ensures Safety Always and vast economy*

Dodge products are made to meet the most modern requirements with a maximum of satisfaction and their service shows it.

**Engineers, Power Plant Superintendents, Shop Superintendents and Buyers should have our "POWER TRANSMISSION ENGINEERING" 350-PAGE ILLUSTRATED CATALOG.**

Your request on your firm's stationery will bring it FREE OF CHARGE.

**Get your copy now.**

## Dodge Manufacturing Co., Ltd.

**Toronto** **Montreal**

**Eastern Warehouse, 640 St. Paul St., Montreal, Que.**

**Agencies in all important centres of the Empire.**

## Dodge Hangers

**are smooth roadbeds for power.**

**Dodge Bearings reduce friction** because there is a true ball and socket connection between the bearing and the frame in Hangers and Pillow Blocks, which permits the bearing to freely align with the shaft.

Dodge Hangers and Pillow Blocks are furnished with ring or capillary self-oiling bearings, all lined with a high-grade metal, and BORED and REAMED. One filling of oil will last 3 to 6 months.

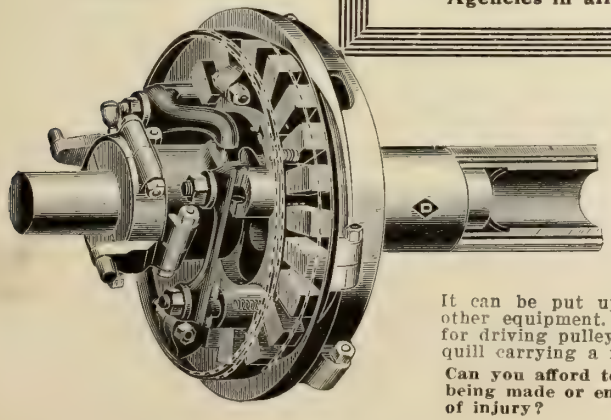
Full particulars in our "POWER TRANSMISSION ENGINEERING" CATALOG.

## Dodge Wood-Split Pulleys

Are balanced and run true. Result of selected, seasoned, kiln-dried stock, combined with skilled workmanship and **twenty-nine years** of "knowing how."

**Over a million** in successful operation, and the output each year is greater than the year before.

Full particulars in our "POWER TRANSMISSION ENGINEERING" CATALOG.

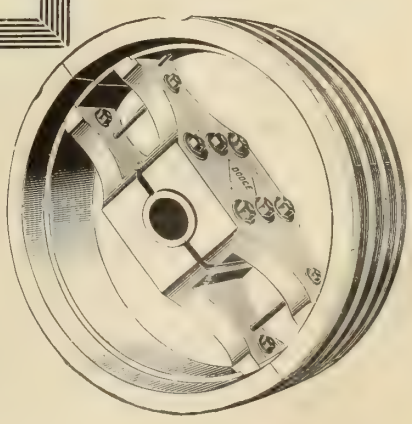


## Dodge Friction Clutch

This Friction Clutch cuts off power in the nick of time—thus putting **your men and machines on the safe side.**

It can be put up or taken down without disturbing other equipment. Can be used as a cut-off coupling, for driving pulley or rope sheave, or for attachment to quill carrying a main driving wheel.

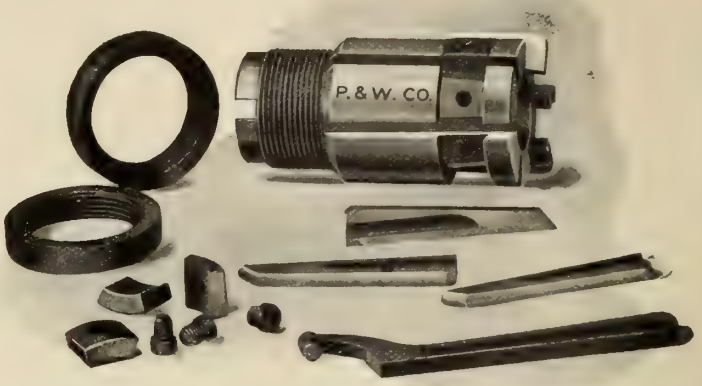
**Can you afford to have machines idle while repairs are being made or employees suing for damages on account of injury?**



# Your Reamers

## Can you keep them up to size?

Make sure that all your reamed holes are smooth and accurate



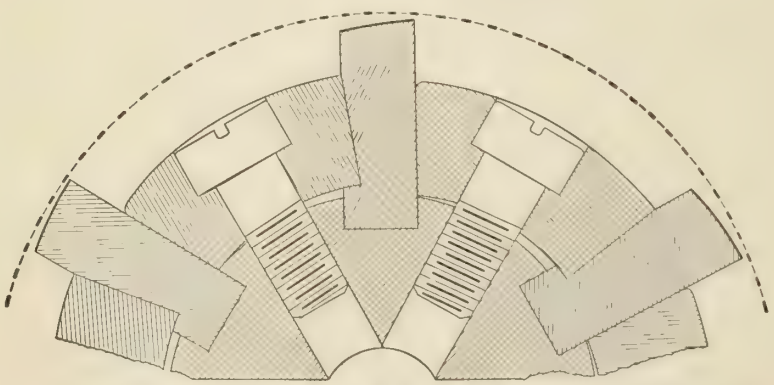
Parts of P. & W. Solid Adjustable Blade Reamers

## Use P.&W. Solid ADJUSTABLE BLADE REAMERS

## Unexcelled for Design, Simplicity and Ease of Adjustment

**1.** The eccentrically relieved blades are stronger than others, do not chatter and produce a smoother hole.

**2.** The hand, shell and fluted chucking reamers have interchangeable nuts, screws and wrenches.



Section showing construction of P. & W. Adjustable Blade Reamers.

**3.** The bottom of a hole can readily be faced.

**4.** By a simple adjustment of the blades the reamer can easily be set to size without regrinding.

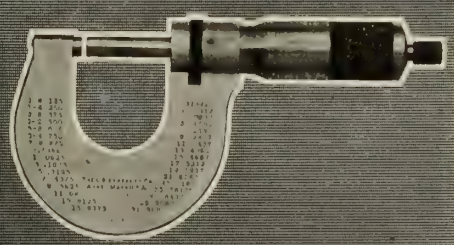
# A Perfect Micrometer for Every Job!

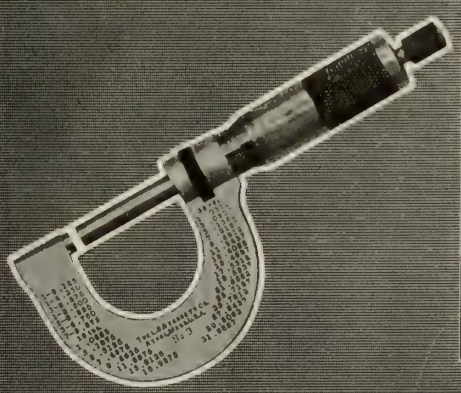
That first essential for a micrometer—accuracy—need only be mentioned when speaking of Starrett micrometers—every mechanic in the country knows that any instrument bearing the name "Starrett" is accurate.

But in addition to their accuracy, Starrett micrometers are made in so many different styles, each adapted to some special kind of measuring, that they have become standard for most good shops.

# Starrett Micrometers



are made in 1" and 2" sizes with ratchet stop and lock nut; also with the quick-acting plunger for rapid measuring. Other styles include thread micrometer for calipering over screw threads, sheet metal micrometer, heavy micrometer for hard use, bench micrometer for inspectors, micrometer depth gages, government micrometer for measurements up to 12", and micrometers in convenient sets.



Wear from long use is taken up by our patented adjustment which permits correction by turning the sleeve until the line coincides with zero on the thimble. This is superior to any other method.

BY INVITATION MEMBER OF

Our 320-page catalog No. 203, giving styles, sizes and prices for all Starrett micrometers, will be sent free on request. **Drop us a card to-day.**

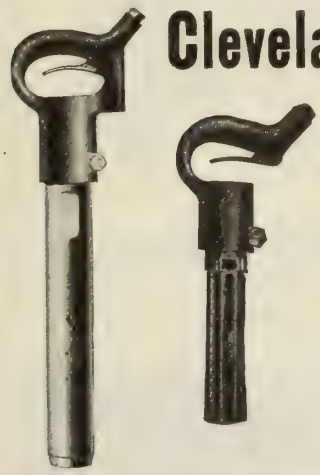
# Cleveland Riveting and Chipping Hammers



Fitted with either Inside or Outside Throttle Lever as preferred. They are made in several different sizes and weights for all classes of work.

The Riveting Hammers have a range in rivets from ¼ inch to 1½ inches.

**CLEVELAND CORNER DRILL For Close Quarter Drilling**

The Body of the Cleveland Corner Drill is in one piece with cylinders and valve chambers cast integral which insures absolute alignment of working parts.

The Driving Crank is mounted upon Annular Ball Bearings which reduce friction to a minimum. Made in two sizes, Nos. 38 and 49, with Nos. 3 and 4 Morse Taper Sockets.

**Either size machine will drill or ream within 1⅛ inch of side wall or corner.**

**IN STOCK:—Sand Rammers, Bench and Floor, Portable Emery Grinders, Air Drills, etc.**

## BOWES AUTOMATIC AIR HOSE COUPLINGS

**Over 1,000,000 in general use**

¶ They are instantly connected or disconnected.

¶ They are absolutely tight under all pressures.

¶ They are interchangeable in all sizes commonly used.

¶ They quickly pay for themselves by stopping costly leaks.

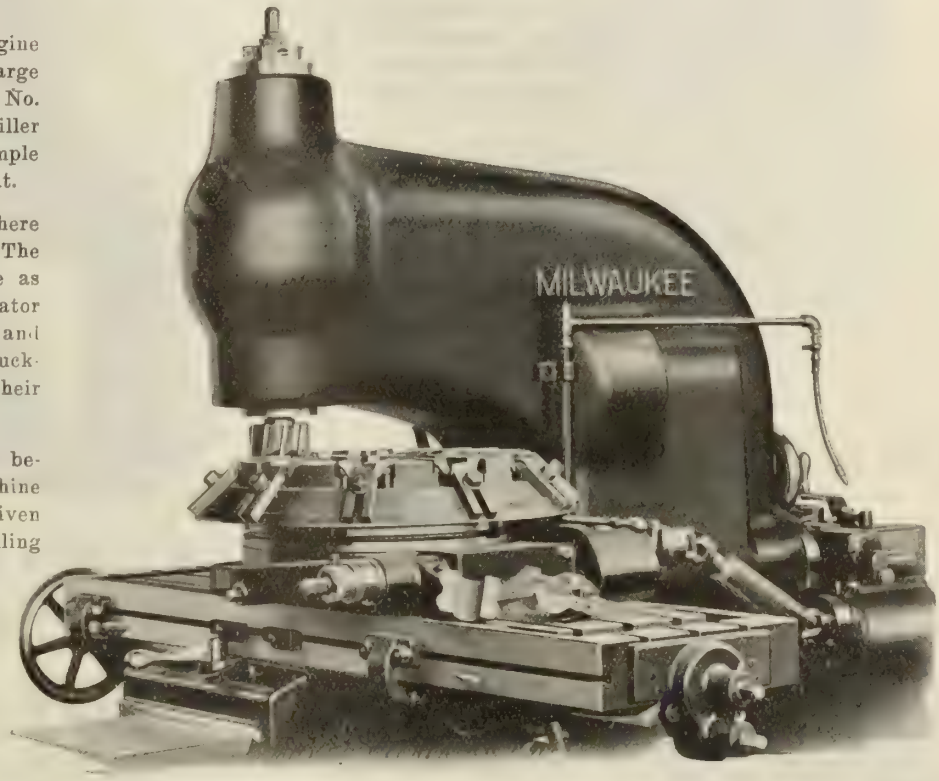
# Milling Automobile Engine Bearing Caps by the Continuous Milling Process

There are the automobile engine bearing caps to be machined in large quantities. And there is the No. 2½B Vertical Milwaukee Miller with rotary table and a simple chucking fixture to accomplish it.

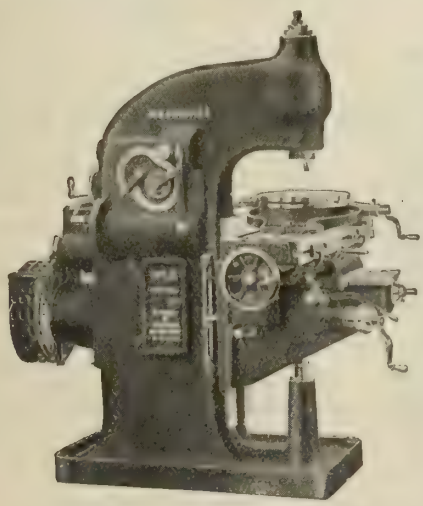
The milling is continuous—there is no time lost in chucking. The cutter finishes piece after piece as the table revolves. The operator stands to the side or front and takes off the finished piece, chucking the unfinished pieces in their places.

The result is a production far beyond that of any other machine tool. Moreover, the pieces are given the superior finish of a face milling cutter.

There are an endless variety of parts and pieces that can be milled to the same advantage by the continuous process. It is an easy matter to design the necessary simple chucking fixture.



Production by the continuous milling process depends almost entirely upon the operator. The Milwaukee Miller will mill the pieces faster than it is possible for an operator to chuck them. In a number of cases it has proven profitable to put two operators to work, one to unload and the other to load.



Where a manufacturer has a horizontal milling machine and does not desire to undertake the expense of a vertical milling machine, the continuous milling process can be performed by using a vertical spindle attachment in connection with a rotary table.

When considering the results you can get on your work by continuous milling, consider also the machine on which you do it.

Aside from the fundamental features and advantages characteristic of all Milwaukee Millers, our vertical type machine offers several values to be found in no other vertical milling machine.

There is ample vertical adjustment, but no unnecessary and weakening adjustment. In other words, the knee is adjustable—the spindle is adjustable only to wear. Adjustment sufficient for all commercial purposes is secured by making the knee only adjustable up and down the column.

By making the spindle head non-adjustable, the main drive gear of the spindle remains in a fixed position immediately behind the main bearing of the spindle. This is a distinct advantage.

Furthermore, we are enabled to extend our cascade lubricating system to the spindle head, so that the hardened steel gears and shafts there are lubricated and flushed with more than a gallon of oil a minute, just as the hardened steel gears and shafts in the interior of the machine are lubricated and flushed.

If you have work you think adaptable to continuous milling, put your problem up to us. We will gladly make suggestions. If you do any kind of milling at all, get the complete facts about Milwaukee Millers. You will find them decidedly interesting. Just ask for our new Catalogue No. 19.

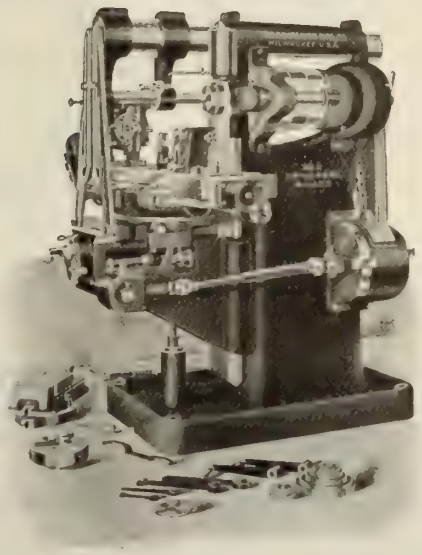
## No. 3 Universal



This No. 3 Universal Miller is an exceedingly versatile machine. It is adapted not only to the highly accurate work of the tool-room, but also to the demands of the Manufacturing Department where capacity, rigidity, and maximum output are required.

It is furnished with wide step cone and double back gears, giving ample pulling power.

An indestructible fool-proof gear-box gives 16 quick changes of feed while machine is operating under cut.

All feeds are reversed and tripped from the extreme front of the knee.

The machine is guaranteed as to accuracy within very close limits.

It is furnished with one of our rigid, compact, highly accurate dividing heads with side centre tailstock.

**Send us your inquiries when you are in the market for a high-grade milling machine.**

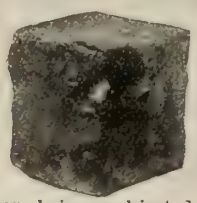
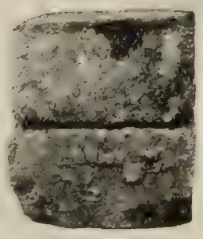
## Perfect Bond Prolongs the Life of the Fire-Brick and Reduces Maintenance Costs



After being subjected to 3000° of heat the bond made with J-M High Temperature Cement has held so perfectly that it can't be seen.



Note the open joint, caused by the disintegration of the fire-clay.

Ordinary fire-clay, when used for setting up fire-brick, crumbles and falls out or fuses at comparatively low temperatures. Therefore, in addition to the face of the brick, the edges and part of four sides are exposed to the intense heat. Rapid disintegration results, frequent renewals are necessary, and much time and money lost through shut-downs.

## JM High Temperature Cement

forms a permanent bond that vitrifies without shrinking or cracking, and actually becomes stronger during the process. Resists heat up to 3100 degrees Fahr.—*as much as some grades of fire-brick can withstand!*

J-M High Temperature Cement can also be used for fire-door linings, door jambs, assayers' furnaces, and, in fact wherever fire-brick is used.

# Why A Time Record But No Belt Record?

You require an accurate time and service record from each employee—why not from your belts? It is just as important.

The "G & K" Belt Record System gives an accurate time and service record of every belt in your plant. It is a dead sure check on just what your belts are doing it "shows up" every belt that "sojers" on the job.

Do not tolerate inferior or incapable belts, check up the "laggards," use the "G & K" Belt Record System, it is absolutely free. Consult us.

**What the System Is.**

The "G & K" Belt Record System shows at a glance the complete history of each belt in your plant—the maker's name, brand of belt, width, length, purchase date, initial cost, on what machine installed, repair cost, in short it is the most comprehensive yet simplest system of its kind and adapted to every plant, large or small.

Remember that a systematic record of your belts is the only means you have of comparing the results of various belts. We welcome comparative tests, they will convince you of the large saving possible by the use of our modern, efficient product.

# The Seed Drill and the Reaper

It is an amusing, and at the same time significant fact that men who criticize and condemn advertising the hardest are the men who advertise the least.

And the most violent critic of the lot is the man who doesn't advertise at all.

These men put up strange arguments against advertising sometimes, and one of their pet diversions is to compare advertising with Personal Salesmanship.

To compare Advertising with Personal Salesmanship is to compare the Seed Drill with the Reaper.

They are separate and distinct. Each performs different functions, yet each are necessary for the common good.

They work together, in the same field, for the same man, to the same end.

Advertising is the Seed Drill of Modern Commerce.

It plants the Seed of Good-Will in the minds of prospective customers. The seed grows to interest, and interest turns gradually into a desire to possess. The harvest ripens and is garnered in by the ever-ready salesman.

The salesman is the Reaper of Modern Commerce.

He reaps where advertising has sown.

Advertising performs the missionary, the educational and the preliminary work—the Salesman comes along and with minimum exertion carries away the order, and frequently all the glory of securing it.

He reaps most who sows the best, and a just man will not forget the seed drill when the reaper is at work.

# The "Cadillac" 1915, Eight Cylinder Automobile Motor

Staff Article

*Automobile manufacturers perhaps more than those in any other sphere of industrial enterprise have striven to completely standardize their product, and have in consequence had installed in their plants much automatic and otherwise special machinery equipment. A radical change such as the introduction of an eight cylinder motor generally means the scrapping of many machine tools, therefore, this Cadillac development arouses special interest.*

CERTAIN practices and principles have become standard in the manufacture of the automobile motor. Among the principles almost universally considered as standard is the four-stroke cycle design. This type engine is also always built single acting, thus there is only one power impulse per cylinder in every four strokes or two revolutions. The problem to be solved has been the construction of an engine that will be perfectly balanced, and to produce such an engine has been the aim of all motor designing engineers.

The old single-cylinder engine, known often as the "one lunger," was early superseded by the four-cylinder engine, and one could almost say that a four-cylinder unit then became standard design for automobile motors because, for several years following, every American factory, with possibly a few exceptions adopted it. However, the demand for a more perfectly balanced engine, one whose operation was more smooth, and one that would develop more power at slower speeds, soon became manifest. Experiments were made with the long-stroke motor and the six-cylinder motor, with the result that the popularity of the combination long-stroke six-cylinder unit grew, a number of large motor firms starting its manufacture to the exclusion of all other types. The six-cylinder motors had, threefore, apparently come to stay, when the startling announcement of the Cadillac Motor Car Co. was published. This stated that their 1915 model car would include an eight-cylinder motor.

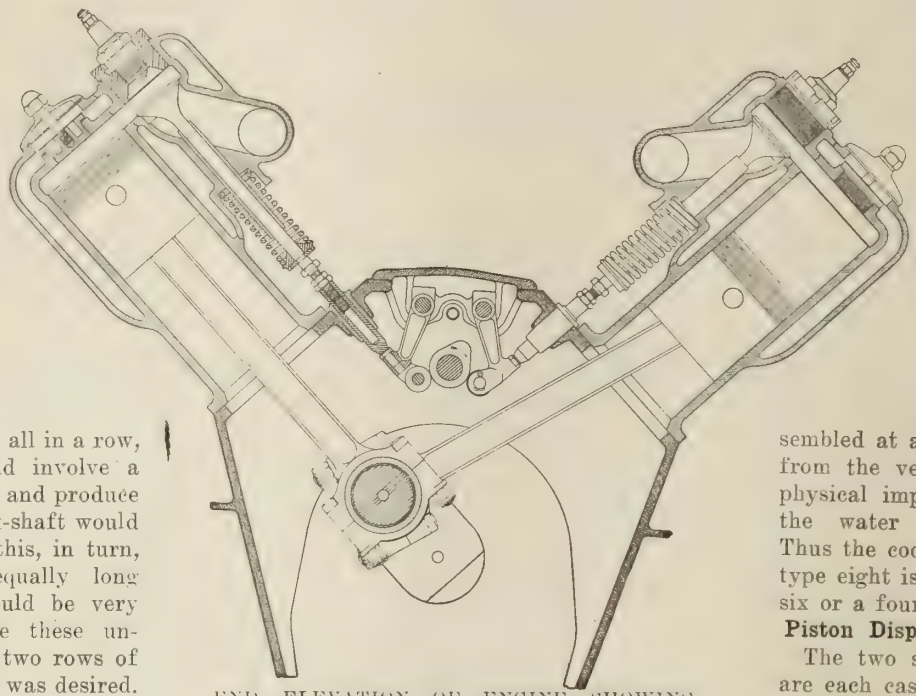
The new Cadillac "eight" has been developed from the French design introduced some years ago by the DeDion Bouton Co. in France. The eight cylinders are arranged in two groups of four each, and these groups are mounted at 90 degrees to each other on the crank-case. The first inquiry one would be likely to make is why "eight" cylinders, and will the addition of two more cylinders make a justifiable difference in performance, as compared with a six-cylinder motor? In an "eight" there are, of course, eight power impulses during each complete cycle of two crank-shaft revolutions; that is to say, there is a power impulse every quarter turn of the crank-shaft, thus there is a complete overlapping of power strokes and the resultant effect is a turning effort that is practically constant. In a "six," a power impulse occurs every one-third revolution of the crank-shaft, and though there is always a turning effort upon the crank-shaft, it fluctuates more due to the longer interval between im-

THE NEW CADILLAC EIGHT-CYLINDER CAR.

pulses. In a four-cylinder motor there are obviously periods when no turning moment is exerted on the crank-shaft, thus the flywheel is called upon to carry the engine over these power lapses. Due to its continuous turning effort, the six-cylinder had become universally popular, yet this continuous turning effort is even more pronounced still in the "eight."

**Cylinder Arrangement.**

The simplest arrangement of the eight cylinders would be to have them all in a row, but this design would involve a great many difficulties and produce an engine whose crank-shaft would be abnormally long; this, in turn, would require an equally long crank case which would be very heavy. To eliminate these undesirable factors, the two rows of cylinders arrangement was desired. If the eight cylinders were in a single row it would require two series of crank-shaft throws, on the quarter, but, by placing the two rows of cylinders at an angle of 90 degrees such a requirement is dispensed with and the same effect accomplished. Thus, the type of motor is known as the V type.



END ELEVATION OF ENGINE SHOWING ARRANGEMENT OF CYLINDERS, OPERATION OF CAMS, WATER JACKETS AND GENERAL DESIGN OF MOTOR. THE VALVES SHOWN ARE INTAKE VALVES. NOTE "TULIP" DESIGN OF VALVES TO FACILITATE ENTRY OF GAS INTO CYLINDERS.

Arranged in this way, the eight-cylinder motor is no longer than the four-cylinder motor of equal bore, and as compared with a "six," it has about one-third less length. This results in a shorter crank-case, which is a weight reducing factor. In addition, the crank-shaft is of the same form as that used in a four, the throws being all in one plane, whereas the throws of a six are in three planes. This results in a simpler process of manufacturing. The shorter shaft is also less given to periodic vibration, and the cam shaft is shorter and less given to whipping. In view of the foregoing, when comparing the new "eight" with the "six" as far as weight is concerned, the "eight" has a decided advantage. Again, the Cadillac "eight" has proved itself to be sixty pounds lighter than the four-cylinder engine formerly used. The difference is mainly due to the fact that it is shorter and has lighter reciprocating parts.

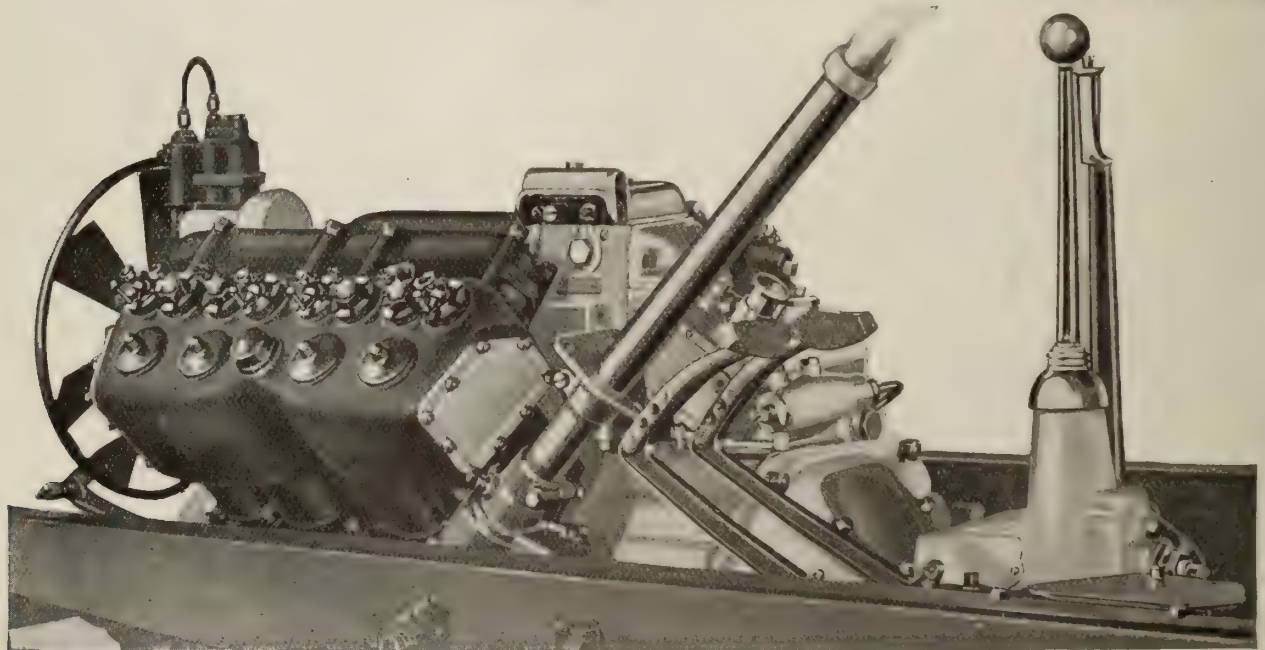
**Cooling.**

Each separate set of cylinders may be cooled separately. Further, the water jackets are so designed that when the cylinders are assembled at an angle of 45 degrees from the vertical, it is almost a physical impossibility for any of the water to get into pockets. Thus the cooling system of the V-type eight is superior to that of a six or a four.

**Piston Displacement and Power.**

The two sets of four cylinders are each cast "en bloc" and present much the same appearance as any other block of four. The bore is $3^1/_8$ inches and the stroke $5^1/_8$ inches, giving a total piston displacement of 314 cubic inches. The S. A. E. formula rates this motor at 31.25 horse-power, although this formula is not really applicable, for on dynamometer tests it has developed 70 horse-power at 2400 revolutions per minute.

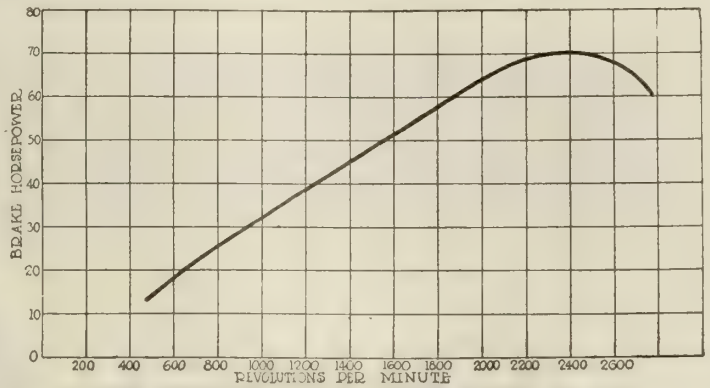
The blocks of cylinders are bolted to the copper alloy aluminum crank-case which



EIGHT-CYLINDER CADILLAC ENGINE AND POWER PLANT PLACED IN CHASSIS. MULTIPLE DISC CLUTCH IS PLACED IMMEDIATELY TO REAR OF MOTOR, AND THE TRANSMISSION GEARS ARE PLACED IMMEDIATELY TO REAR OF CLUTCH. GEAR SHIFT LEVER IS SHOWN WITH THE BALL HANDLE.

is common to both, and which is split horizontally into two sections, the lower portion being the oil pan. The upper half carries the crank-shaft which has three main bearings. Both sets of connecting rods connect to this crank-shaft, one throw-bearing taking care of a pair of rod-ends, in opposite cylinders. In order for both to fasten on the same bushing, one rod has a yoked end, the other rod fitting within the yoke arms. Two caps are thus required for the yoke, one for each arm of the yoke. These fit around the outer part of the bushing, gripping it rigidly, due to the cap bolts. In addition, pins go through the rod into the bushing so as to insure the two moving together. The other rod fits around the bushing within the yoke, and is free to turn on the bushing. Thus, in operation, the bearing for the yoke and rod is the inner surface of the bushing against the shaft, while that of the other rod is the outer surface of the bushing. These bearings have babbitt linings in reinforced phosphor-bronze shells. There are, therefore, four connecting-rod bearings on the crank-shaft just as with a four-cylinder motor. The total length of the crank-shaft to the outer ends of the end bearings is 26 1/16 inches.

Directly above the crank-shaft is the single camshaft with but eight cams, one cam operating two opposite inlet valves, or two opposite exhaust valves, as the case may be. The cam assembly is on the under side of a plate which bolts to the top of the crank-case between the two blocks of cylinders. Pivoted to this plate also are the small arms which are interposed between the ends of the push-rods and the cams, so that the lift will be straight upward instead of being a side thrust component. The cam-shaft is supported by five bearings, while a small air-pump maintaining a pressure for fuel feed is driven by an eccentric located on forward end of cam-shaft.

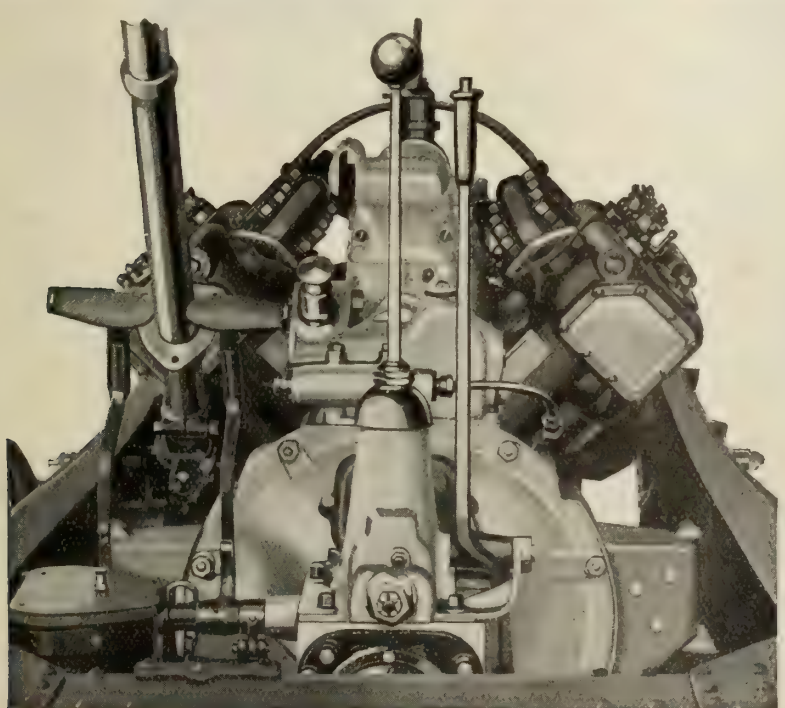


CURVE SHOWING BRAKE HORSE POWER AT ALL REVOLUTIONS FROM 400 TO 2600.

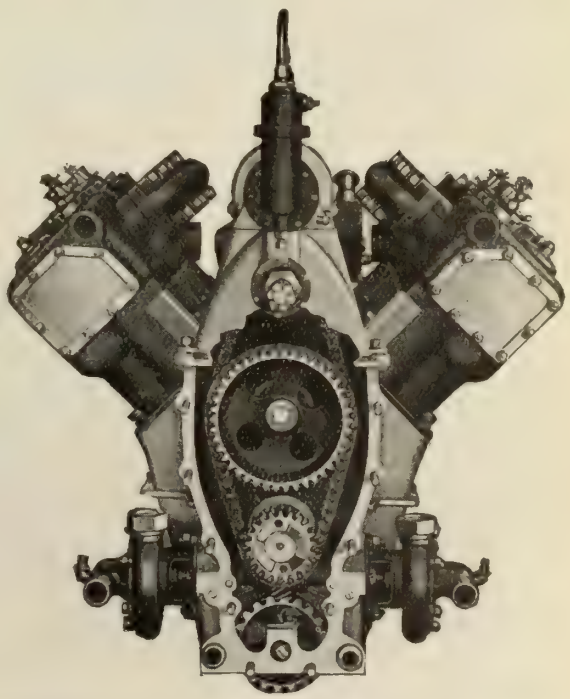
Vertically in line above the cam-shaft and crank-shaft is the generator shaft which drives the fan and the combined motor-generator mounted on top of the cam-shaft plate, and lying between the cylinder blocks. This generator shaft also carries a gear which may be meshed with that of the tire pump carried at the forward end of the motor. Both the cam-shaft and the generator shaft are driven by silent chains which are completely housed at the front end of the motor. The cam-shaft carries two sprockets, the outer carrying the chain running down to the crank-shaft sprocket and the inner driving the chain which passes around the generator shaft sprocket above. The water and oil pump drives are interesting.

At the front of the engine, and below the crank-shaft, is a transverse shaft driven from the crank-shaft by spiral gears. There is also here a centrifugal water pump for each of the two sets of cylinders, one being located on either end of the transverse shaft. Below the spiral gear on the water pump shaft is located a third spiral gear, whose shaft is parallel to the crank-shaft. A small gear oil pump is located on the forward end of this shaft for crank shaft bearings and connecting rod supply.

In order to secure the accurate balance necessary to a high-speed motor of this type so that it will be practically free from vibration, the pistons and connecting rods are machined to very close limits. Uniformity of weight is also important. Remarkable lightness of these parts has been attained due to the use of a special alloy steel for the rods which possesses great strength with extreme lightness, and also to the special form of the cast-iron pistons, each of which has three ring grooves, with three thin steel rings per groove. The wrist pins are fixed in the connecting rods and oscillate in the pistons. They are constructed of chrome nickel steel, case-hardened and are 5/8 of an inch in diameter.



ENGINE MOUNTED IN CHASSIS. VIEW FROM THE REAR.



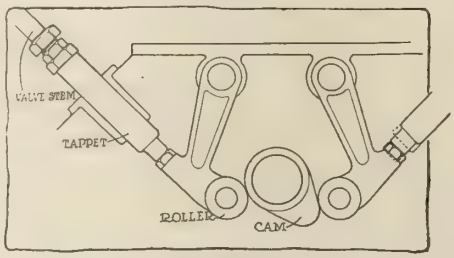
FRONT VIEW OF ASSEMBLY OF ENGINE

As another indication of the refinement to which this motor has been subjected, the intake valves are of the tulip shape design so as to facilitate the inlet of the gas, while the exhaust valves are of the flat type and are of tungsten steel.

### Order of Firing.

In firing, the order alternates from one side to the other, so that there is a power impulse first from a cylinder on one side followed by an impulse from a cylinder on the opposite side. The order of firing in each set of cylinders is as follows: One, three, four, two, it being always understood that the forward cylinder is cylinder number one and the rear cylinder is cylinder number four. It is now apparent that there will be the same definite interval between the firing of all cylinders of the same numbers on opposite rows.

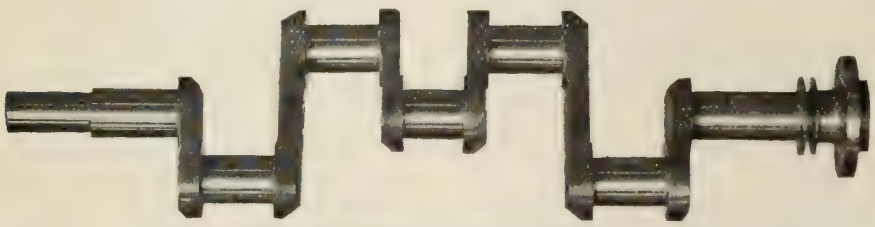
making two revolutions to obtain an impulse from each of the eight cylinders; thus an impulse occurs for every quarter turn of the crank-shaft:



CAM MOVEMENT APPLICATION TO VALVE STEM.

One right—four left.
Three right—two left.
Four right—one left.
Two right—three left.

The accompanying diagram will perhaps more clearly express the matter:



EIGHT-CYLINDER CRANK SHAFT.

The direction of rotation of the crank-shaft and the cam shaft is the same, and is such that the right-hand cylinders fire before those of the left-hand of the same numbers. The interval between these two cylinders is that which the cam-shaft requires to make one-quarter of a revolution, because the cylinders are set at 90 degrees, and this one-quarter revolution of the cam-shaft represents a one-half revolution of the crank-shaft. With this explanation, the order of firing will be as follows. the crank-shaft

Front

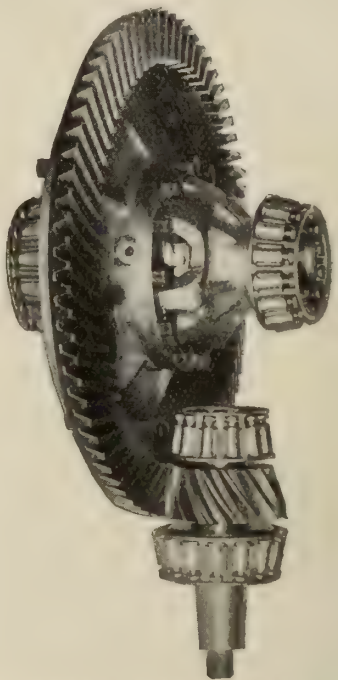
|---|---|---|---|
| | (6) | (1) | |
| Left | (4) | (7) | Right |
| | (8) | (3) | |
| | (2) | (5) | |

Rear.

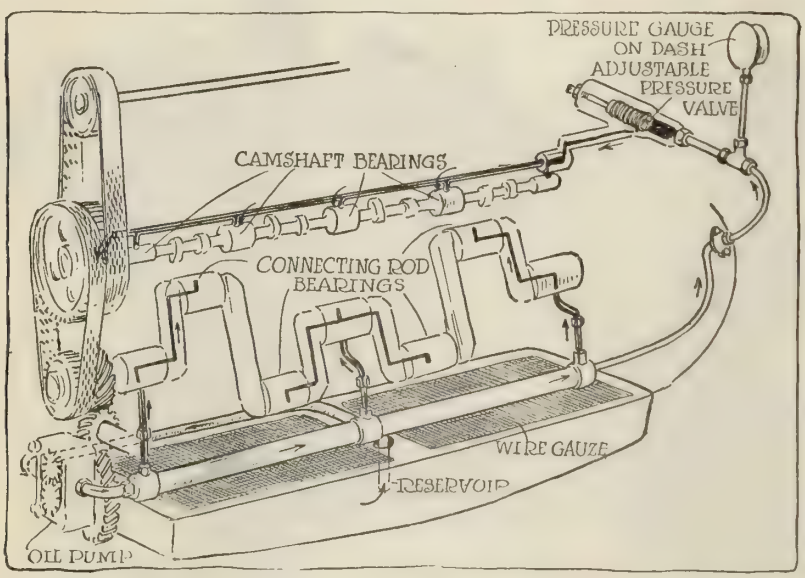
The valves are timed as follows: All inlet valves start to open on top dead centre and close 45 degrees beyond bottom dead centre. The exhaust valves open at 45 degrees before bottom dead centre and close at top dead centre.

### Carburetor.

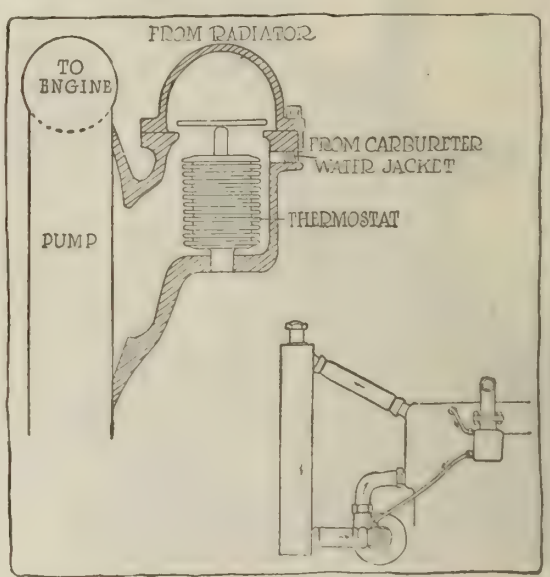
The Cadillac single-jet carburetor, specially designed for this type of motor, is used. It occupies a position midway in the engine between the two rows of cylinders and a form of U manifold leads from it to the intake manifold of each of the two blocks of cylinders. The distribution to the various cylinders is done within the castings and pressure feed supplies gasoline to the fuel chamber of the carburetor.



SPIRAL BEVEL DRIVE GEAR AND DRIVE PINION WITH TIMKIN ROLLER BEARINGS, ALSO DIFFERENTIAL GEAR SET IN SPHERICAL HOUSING IN HUB OF DRIVE GEAR.



DIAGRAMATIC VIEW OF OILING SYSTEM. OIL IS STRAINED THROUGH METAL NETTING AND GRAVITY FED TO PUMP.

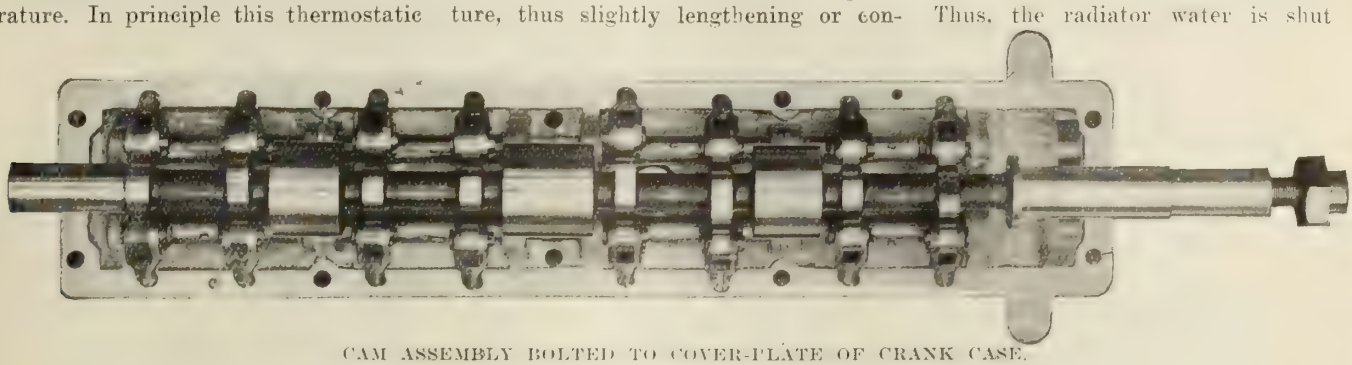


DIAGRAMATIC VIEW OF THERMOSTAT AND THE VARIOUS PASSAGES FOR WATER CIRCULATION.

### Water Circulation Control.

An entirely new feature in automobiles is the application of thermostatic

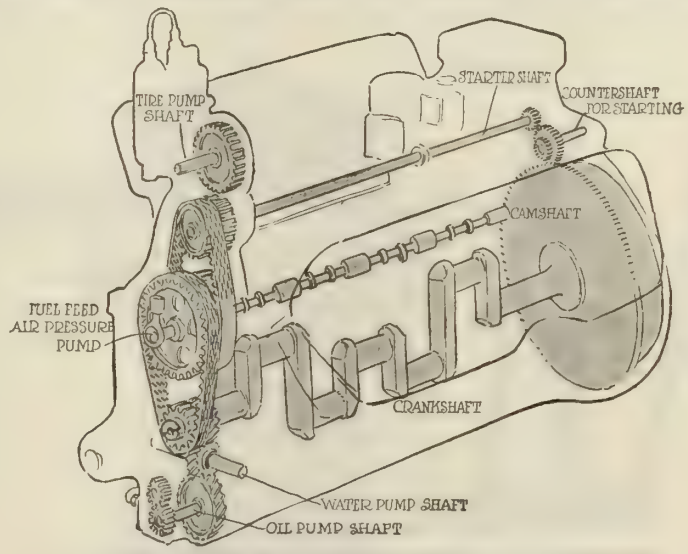
control to the temperature of the cooling water, so that in running, this water is maintained at nearly a constant temperature. In principle this thermostatic regulation is the same as that used in connection with the heating systems of houses.



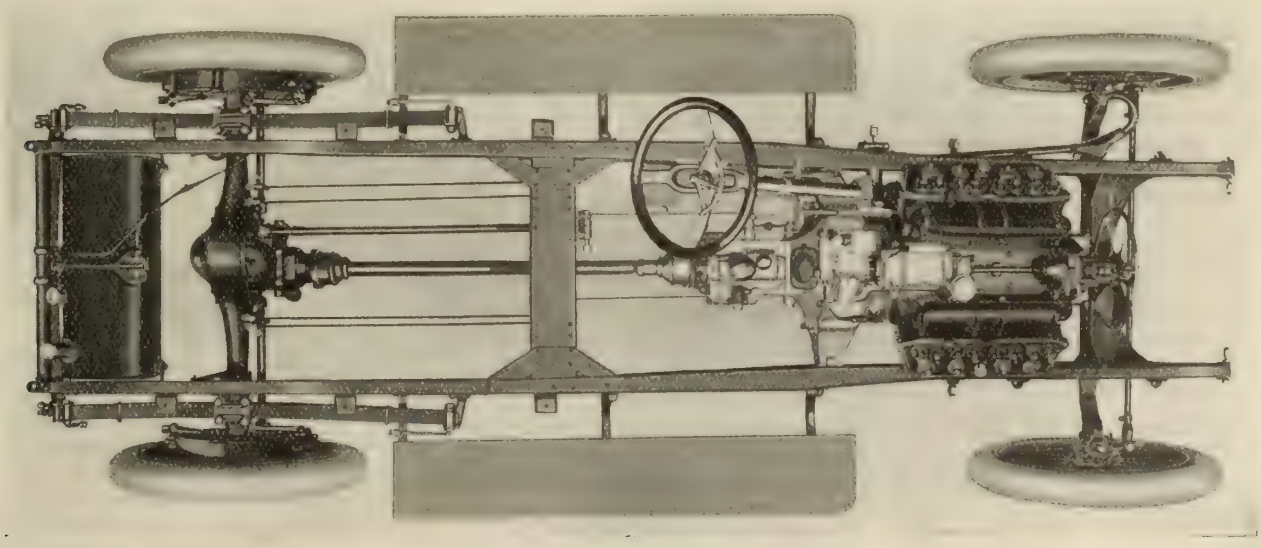
CAM ASSEMBLY BOLTED TO COVER-PLATE OF CRANK CASE.

BLOCK CASTING OF FOUR CYLINDERS. NOTE LARGE WATER JACKET AND ALSO THE FACT THAT COMPLETE ACCESS TO SAME IS OBTAINED THROUGH THE LARGE HAND-HOLD COVERS.

In the Cadillac application, there is interposed in the water pump line for each set of cylinders a thermostat which is simply a small coiled copper tube containing a liquid which expands or contracts in accordance with the temperature, thus slightly lengthening or contracting, its total movement being $\frac{1}{4}$ in. This thermostat is in connection with a valve so that when it expands, it raises the valve from its seat, the valve controlling the flow of water to the radiator from the pump. A by-pass connects with the water-jacket of the carburetor. When the engine is started, the water is naturally cold, therefore the thermostat is contracted and its valve is on its seat. Thus, the radiator water is shut off, the circulation being simply through the water-jackets of the cylinders, through the by-pass to the carburetor jacket, and thence back to the cylinders. There is, therefore, only a small quantity of the water circulating, and when this heats up, the thermostat begins to



DIAGRAMATIC VIEW OF ENGINE SHOWING ARRANGEMENT AND DRIVES OF THE VARIOUS ACCESSORIES OF THE ENGINE.

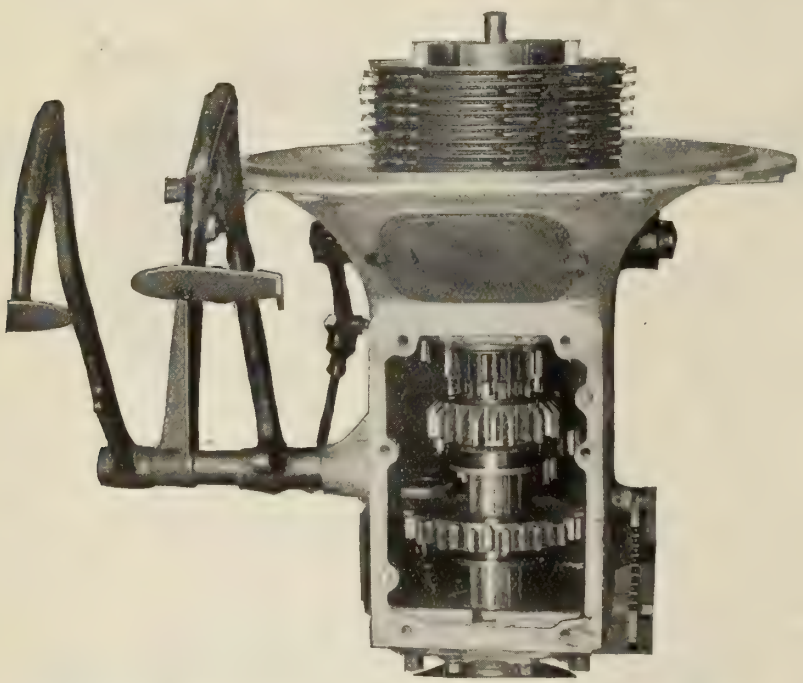


CHASSIS ASSEMBLY OF THE EIGHT-CYLINDER MOTOR.

expand and lift its valve from the seat, thus allowing the radiator supply to flow into the system, The action is so regulated that the temperature of the water is nearly constant.

### Motor Lubrication.

The motor lubrication system incorporates a positive force feed system. An oil gear pump, located at the forward end of the motor and driven from the crank-shaft, takes up the oil from the oil pan in the lower part of the crank-case, and forces it through a reservoir pipe running along the inside of the crank-case, from which pipe there are leads to each of the main bearings. The crank-shaft and webs are drilled and oil is forced from these main bearings to the connecting-rod bearings through the drilled holes. The forward and rear main bearings supply the rod bearings nearest them, while the central main bearing supplies the rod bearings on either side of it. The oil is then forced from the main reservoir pipe up to the relief valve which maintains a uniform pressure above certain speeds and overflows from this valve to a pipe extending parallel to the cam-shaft and above it. Leads from this pipe carry lubricant by gravity to the cam-shaft bearings and front-end chains. Pistons, cylinders and piston-pins get their oiling from the oil thrown by the lower ends of the connecting rods.



MULTIPLE DISC CLUTCH AND TRANSMISSION GEAR. NOTE THE DESIGN OF SAME.

### Electrical Accessories and Ignition.

The Delco electrical system consisting of a combination unit for cranking, lighting and ignition is employed, while a feature of the unit is the special eight cylinder distribution. The motor-generator unit runs at the cam-shaft speed and is driven by a silent chain. At the rear of the generator is the train of gears which mesh with the teeth in the flywheel rim for cranking purposes, and these gears are not in mesh unless the starter pedal is depressed. The reduction between the electric motor-generator speed and the engine speed is 25 to 1. The Delco unit, while cranking the engine temporarily becomes an electric motor and turns over the engine. The current is received from a storage battery.

### General.

When on the road the performance of this car is indeed a surprise, a speed of from two and a half to three miles per hour, to the maximum, being obtained when running on high gear. The long stroke and the very generous over-lapping of power impulses make the motor an ideal hill climber, it being practically impossible to stall the motor. Again, the motor accelerates the speed of the car very rapidly, and thus but little time is lost in crowded streets. For touring, the car negotiates heavy roads and hills with comparative ease.

The steering wheel is placed on the left and two separate exhaust pipes and mufflers are fitted to the car. With the old four-cylinder motor, a two-speed rear axle was fitted to the car, but the extreme flexibility of the new eight-cylinder motor redners this type of axle of no avail, so the simpler form of one-speed axle is used.

A real appreciation of this new engine cannot be realized until one has driven one of these new cars, and to drive such a car is to become immediately converted into an ardent supporter of the eight-cylinder motor, and what is perhaps of not the least importance, the price of the Cadillac 1915 eight-cylinder model is the same as that of the 1914 four-cylinder car.

## LOCAL CASE-HARDENING.

LOCAL case hardening of steel formed the subject of paper read recently by Guillet and Bernard before the Societe d'Encouragement pour l'Industrie National of France. The methods employed were summarized as follows:

1.—The parts to be protected against cementation are covered with fire clay, but the protection thus furnished is not complete, as the gases penetrate the fire clay, besides in complex shapes the method becomes complicated and expensive.

2.—A tube is shrunk over the parts which are to remain uncemented, the thickness of the tube being slightly greater than the depth of case required. After the cementing process the tube is broken off. The method is obviously very limited in its application.

3.—The object is made with extra thicknesses in those parts which must not be hardened, and after cementation and before hardening, these extra thicknesses are machined off . The process is very expensive.

4.—The parts not to be cemented are protected by a metallic deposit which must be (a) solid at the cementing temperature; (b) impervious to the cementing materials; (c) easily obtained commercially, and (d) easily removed after the operation. Copper and nickel are the only metals which fulfil conditions (a) and (c), and the latter fails to comply with condition (b).

The metal may be dsposited by immersion in a salt solution, by electrolysis, or by the Schoop spraying process. The first-mentioned is not satisfactory owing to the thinness and uncertain adherence of the coating. The electrolytic process, is cheaper to install than the spray process, which, on the other hand, is quicker and more easily localized.

**Analysis by Sparks.**—The spark test of steels in forge shops and tool room is placed next to precise chemical analysis by J. F. Keller, of Perdue University. A chart, 18 by 24 inches in size, has been prepared, and shows the colors and general appearance of the sparks for steel of many different compositions. Comparisons of the sparks with this chart serves to separate iron, mild steel, tool steel, high-speed steel, magnet steel, and so on.

## TURRET LATHE SET-UPS REQUIRING MULTIPLE TOOLS.

By F. Scriber.

ALTHOUGH the use of a number of cutting tools at once is common manufacturing practice, where special lathes are concerned, the extent to which this usage can be successfully carried out, is often in doubt. The accompanying illustrations show two such applications to turret lathes which make combinations that have secured good results.

Fig. 1 illustrates a method of machining the spur gear shown in Fig. 2, the operations on which are as follows:—The gear is first gripped in a three-jawed chuck with the long hub towards the turret, and the hole spotted with the short drill A, Fig. 1. This drill is held in the turret by the holder B and, at the same time as the spotting is being done, a back facing tool is fed through the spindle to face off the short hub C, leaving the work in the condition shown at the first turret face.

At this point the turret is indexed to the next position, and the set of tools on the second turret face is brought into play. These consist of a two-lipped drill D to open the hole through the piece, a blade E for facing the end of the long hub and two blades F and G for turning the corresponding diameters of the hub. The last three tools are held in the cast iron holder I. There are also two facing tools I and J, which clean up both sides of the gear. These are held by tool posts to the cross slide of the machine. The periphery or outside diameter is turned by the tool K which is held in the turret as shown.

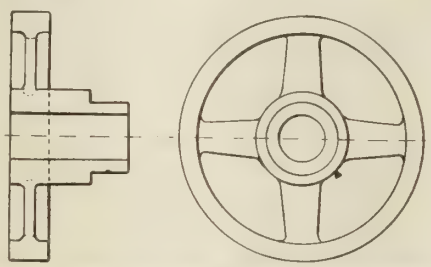

FIG. 2. GEAR BLANK TO BE MACHINED.

This completes what might be called the roughing set-up and leaves the gear in its finished shape but not sized. For finishing the work, a similar set-up is used on the 3rd turret face with the exception of the tool for the bore of the gear. Instead of a drill a boring bar is used having a pilot on the end which is a running fit for the facing tool C; thus tying all the tools on the third turret face to the headstock which prevents chattering and makes a very rigid tool combination for the finish turning operation.

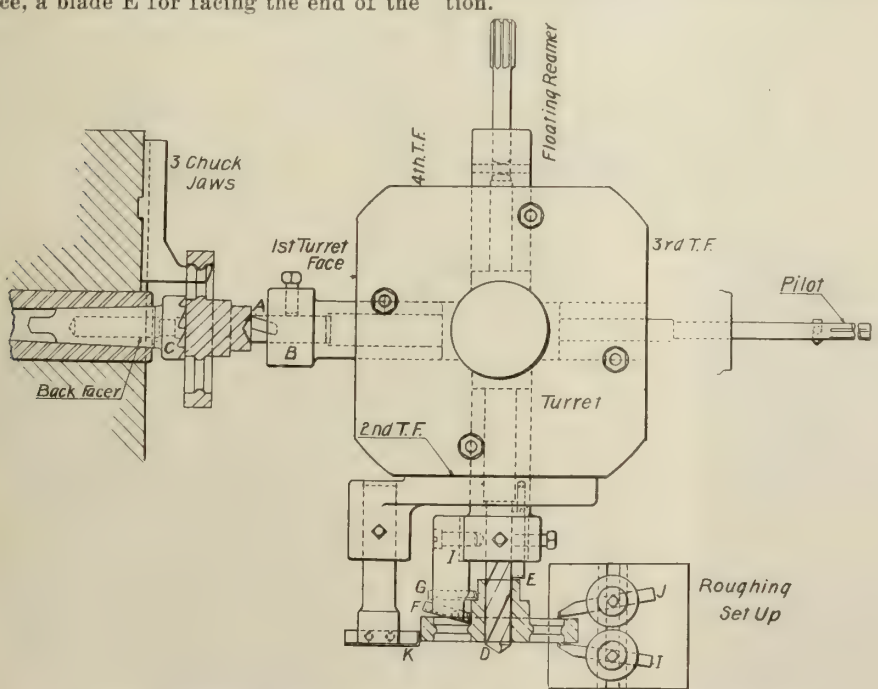

FIG. 1. SET-UP FOR ROUGHING AND FINISHING GEAR BLANK.

As it is customary to ream these gears after boring, the fourth and last turret face is used to carry the floating reamer and holder. This reaming operation is the last of the four which finish the nine faces of the gear.

In Figs. 3 and 4 are illustrated similar methods for machining a gear case. This requires two large formed mills combined with boring bars and a milling fixture to hold the gears while machining the small diameter face. The work is first gripped by the medium diameter in the three special chuck jaws which are made to just bear on the small diameter of the work and thus steady it while being machined. The piece is roughed by a combination of tools such as is shown in operation on the piece and are as follows:—The small hole comes cored and is bored with the bar A held in the end of the roughing head. The inside is finished by the formed boring head B, which carries the boring bar and is in turn carried in the turret hole.

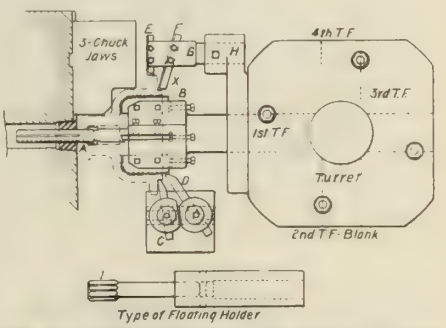

FIG. 3. ARRANGEMENT OF TURRET AND TOOL POSTS FOR MACHINING GEAR CASE.

The end and flange is roughly faced by the facing tools C and D held on the cross slide, while the diameter X and periphery are turned by the blades E and F in the stem G which is held to the turret by the holder H. This completes the roughing operation. The finishing is done by a similar set of tools attached to the third turret face, the second being left blank. The hole is finished by the floating reamer I attached to the fourth turret face.

On this piece, the small diameter could not be faced at this setting, so a gang milling fixture shown in Fig. 4 was designed for the purpose. The fixture provides for four pieces at one setting, and these are held by means of clamps and studs at shown. The cases are slipped over the studs A and are held down by the clamps B, while a surface mill in a vertical milling head quickly faces off the hub, thus completing the machine work on this piece.

When adapting the turret lathe for multiple turning, we have the advantage of a number of tools acting simultaneous-

ly on one piece, a proceeding which may even assist by balancing and steadying the work. Care must be exercised, however, in estimating the ultimate cost of the whole work. The tool cost is fairly high; the setting up and adjusting requires considerable expensive time and, while arranged for a particular job, the machine can seldom be used for anything else. Although the time of actual machining is much reduced, the savings on a considerable number of pieces are required to pay for the set up and extra tools.

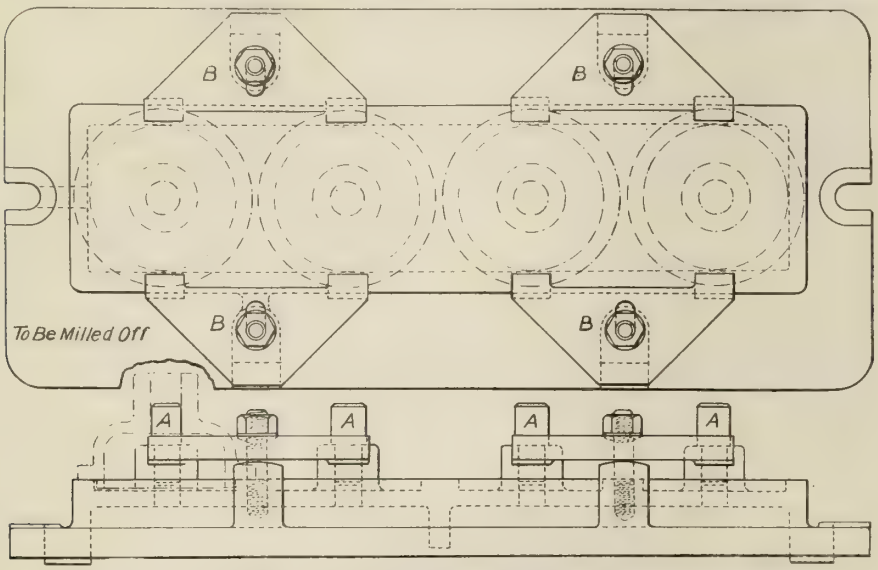

FIG. 4. MILLING FIXTURE FOR FACING HUBS OF GEAR CASE.

## CRANK SHAFT KEYSEATING FIXTURE.

By D. O. Barrett.

THE crank shaft shown in Fig. 1 was used in large quantity production of 1½ horse power gasoline engines, the diameter of same being 1¼ in. with a 5/16 in. keyway. The crank pin was of the same diameter. The shafts were to be keyseated in multiples of four on a plain milling machine and, in order to make time, is was necessary to eliminate all false movements and get them into and out of the machine as quickly as possible.

The main fixture is shown in Fig. 2; this consisting of a casting bored out to take the four shafts at the proper distance apart, the outer ones being spaced 2¼ in. while the inner ones were but 2 in. It will be noticed that the casting was cored out from below and in this space was located the clamping mechanism. Feet extended on either side by which the fixture was clamped to the table, a locating key fitting the centre table slot. A ¾ in. slot was milled lengthwise through the centre of the casting at the top, between the holes for the outer shafts and down to a little below the centre of these holes. In this slot were placed the two T-head clamping bolts, these being bored on the ends to conform to the contour of the shaft. These bolts extended down through the body of the casting, the holes for same being drilled 1/32 in. large to allow the bolts to adjust themselves on the two shafts. In the space at the bottom these bolts extended through a 1 in. x 1¼ in. machine steel tie bar, and were provided with locknuts for adjusting purposes. On each side of this tie bar was a ⅜ in. x 1¼ in. cold drawn steel bar which was slightly upset at the one end to form a bearing against the under side of the casting. These bars extended out through the end of the body and were hinged to the tie bar at the centre, while a 1 in. piece was riveted between the outer ends.

It will be seen that any downward pressure on the end of this clamping bar would exert a downward pressure on the T-bolts through the medium of the tie bar. This downward pressure was obtained by means of an eccentric. Two ears were extended out from the main casting, and between these the eccentric was placed, this with the handle being a one-piece forging. Heavy springs under the heads of the clamping bolts served to raise the entire clamping mechanism when the lever was turned to the position shown.

In Fig. 3 is shown the device for clamping the outer ends of the shafts, the same casting being used as for Fig. 2. After the holes had been bored for holding the shafts, the top portion was planed off as shown. The clamping bolts were long enough to extend out over and rest on the tops of the shafts, pulling them straight down into their seats. When the clamping device was released, the T-head clamping bolts are given a quarter turn when the shafts may be slid back out of the first fixture and then lifted directly out. Both of these fixtures were bored out with the same settings so that the relative positions of the shaft holes with respect to each other and the locating keyway at the bottom would be exactly the same.

These shafts were keyed with the

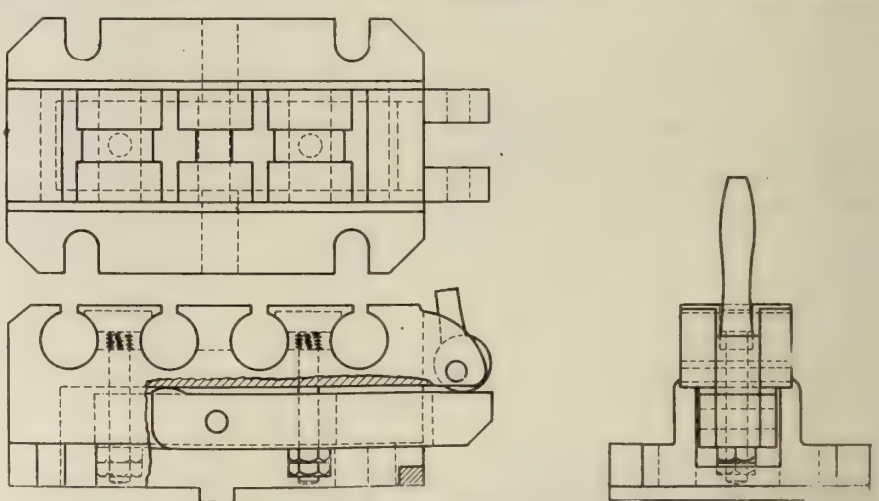

FIG. 2. MAIN KEYSEATING FIXTURE.

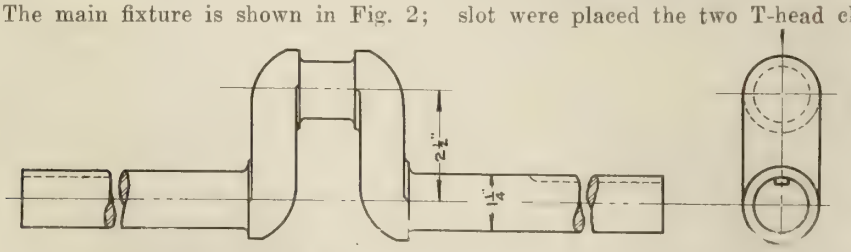

FIG. 1. TYPE OF CRANKSHAFT TO BE KEYSEATED.

throw of the crank so that they had to stand vertical while being keyseated. Any tilting to one side would displace the keyway from its proper position relative to the crank and this, in turn, would cause the balance weights in the flywheels to be thrown either forward or back. The device shown in Fig. 4 was used to bring the pins into their proper locations. The main casting was bolted to the two outer table slots next the body of the machine. The piece A was of 1 in. cold drawn steel with a ½ in. pin in the outer end to act as a handle. When this piece was pushed up and back, it would assume a position slightly back of the vertical, due to the angle at which the end was cut. When the cranks were placed in the clamping fixtures, the pins were brought as near as possible to the vertical position, the inner crank being pushed against the finished pad on the casting. The piece A was then brought down, which action placed the pins the proper distance from each other and threw the cranks to the vertical position, after which they could be clamped, this being accomplished by merely pulling down the cam levers at the ends of the fixtures.

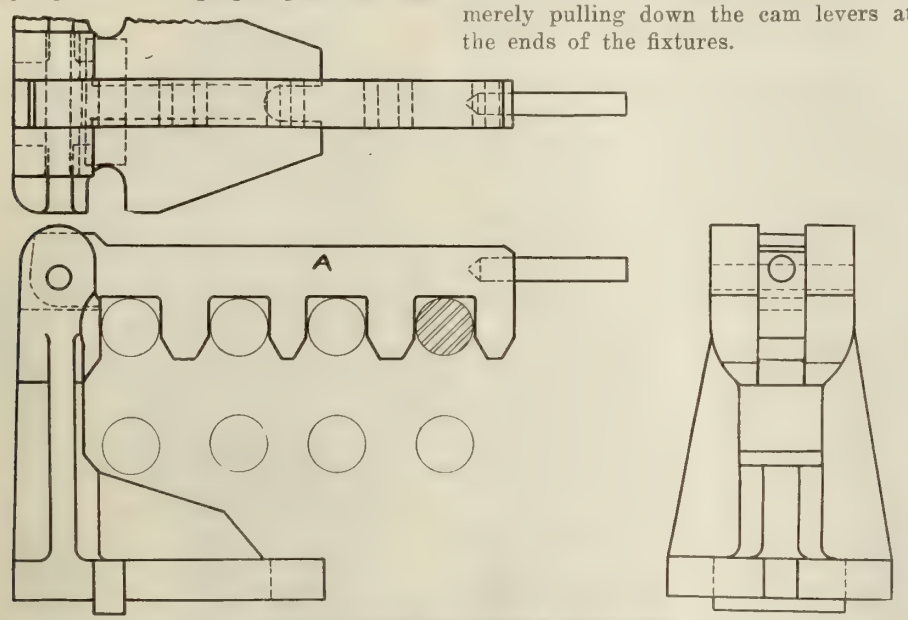

FIG. 4. LOCATING DEVICE FOR PINS.

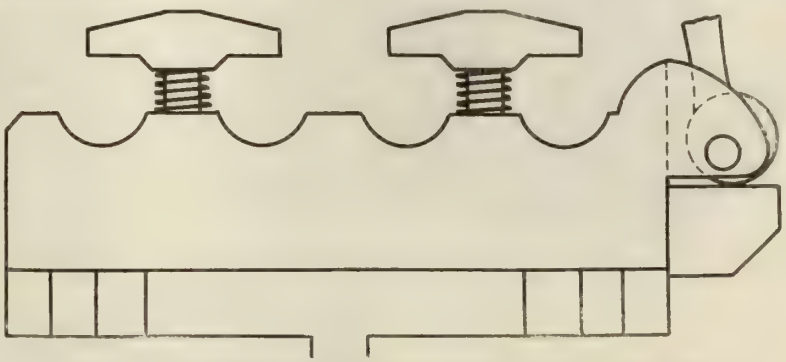

FIG. 3. CLAMPING DEVICE FOR OUTER ENDS OF SHAFTS.

## A SHAPER TOOL.

By L. B. E.

A shaper tool here described will be found very useful in the toolroom. The regular toolpost is removed and the tool bolted to the clapper block. A spring at A gives a quick return. The cutting tool B is so clamped into the split end of the holder that it may be turned in various directions when shaping out an odd-cornered or any kind of hole. The tool is especially good for boring bar slots, in which case the bar may be clamped to the shaper table as shown at C.

## REAMING SMALL GEAR BLANKS.

By A. E. Granville.

THIS drill press fixture is used for reaming small brass gear blanks, which are made from round bars in a screw machine, being drilled and cut off. The thickness is not so important as the other dimensions. A handful of the drilled blanks is placed in the tray A and are pushed in between the vise jaws B and C with the fingers of the right hand, while the movable vise jaw is worked with the left hand on handle D. As the reamer is brought down by means of handle E, it will be seen that it is impossible to injure the fingers by jabbing the reamer down on them, since the spindle flies up the instant the lever is released. This device is not only rapid and convenient for reaming the work shown, but may be used for small collars, washers, nuts or other similar work.

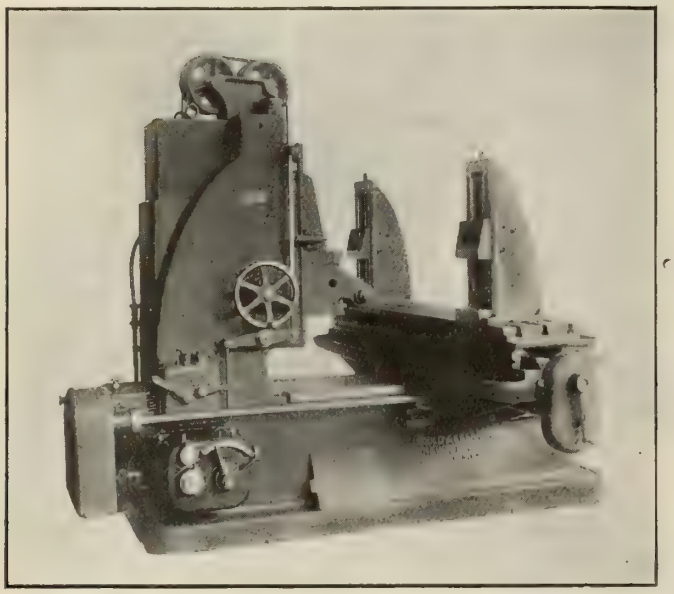
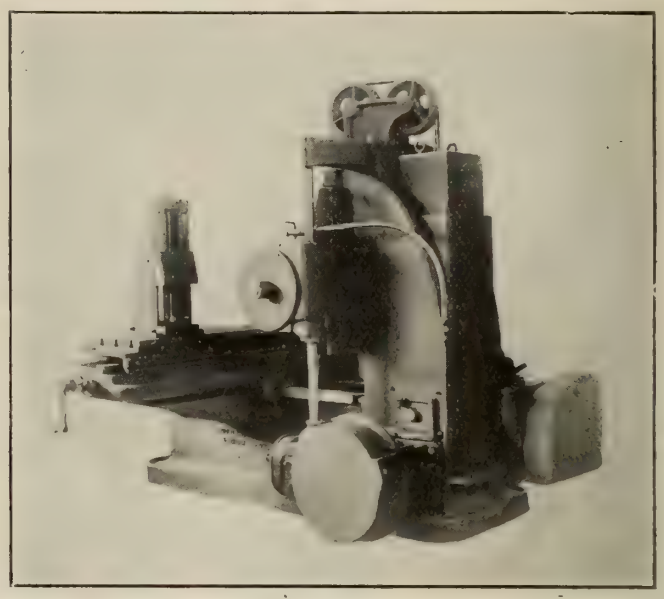
## NEW STYLE RACK CUTTING MACHINE.

ANOTHER size rack cutting machine of their so-called light type has recently been brought out by Gould & Eberhardt, Newark, N.J. It has a capacity for cutting racks 60 in. long by 10 in. face, up to 1½ d.p. in cast iron and 2 d.p. in steel. The make-up consists of the firm's 60-in. by 16-in. vertical cutting gear cutting machine with the substitution of a rectangular work table for the ordinary circular work, and the addition of an extra auxiliary cutter spindle. It is an automatic rack cutter in every sense of the word, but has additional commercial value in being readily convertible to the standard 60-in. by 16-in. spur gear cutting machine, by the substitution of the regular circular work table and carriage. The work table indexes automatically and, while the indexing is being performed, the cutter slide is locked so that it cannot feed down until the indexing is complete. Single or gang cutters may be used and the machine will index automatically for the number of cutters being used at one time. The work table indexing screw is extremely accurate and a micrometer is provided so that table with rack being cut can be moved slightly without disturbing the indexing gears. This makes it possible to cut racks longer than the machine is rated to do, or it will cut sections of racks that are to be matched together as one long piece.

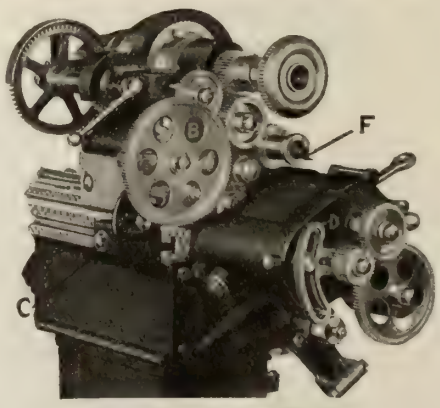
The illustrations show two vises mounted on the table, although these are not regularly furnished with the machine. They illustrate how several racks can be mounted on top of each other. The indexing mechanism is positive, and there are 16 changes of feed which may quickly be had by means of a very compact feed gear box. A wide range of cutter speeds is also available. Only one belt is required to drive the entire machine, and the driving pulley is completely enclosed in a neat guard; all running gears are enclosed. For the accommodation of plants who may not have enough rack work to keep a machine like this busy, an indexing table for cutting spur gears or spur and bevel gears can be furnished, and as it only takes a few minutes to change over for cutting either racks or gears, the machine is ideal for both manufacturing and gear jobbing.



NEW STYLE RACK CUTTING MACHINE



NEW STYLE RACK CUTTING MACHINE



Q.C.S.P. LATHE DETAIL.

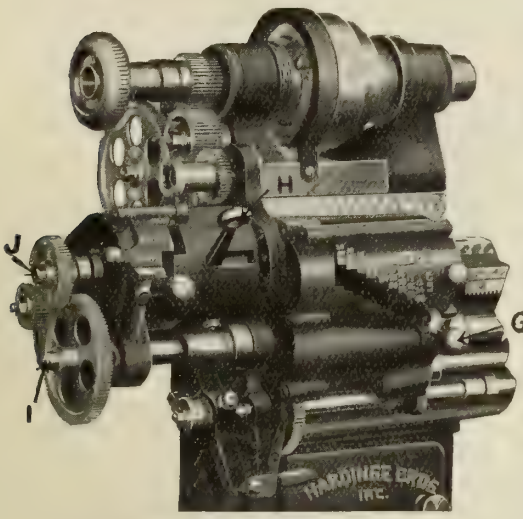
## QUICK CHANGE SWING PRECISION LATHE.

HARDINGE BROS., INC., Chicago, Ill., have recently added to their line of products what is known as the Cataract quick change precision lathe. Quite a number of interesting features are to be noted in the general and detail design and construction of this machine, and these, the accompanying text and illustrations will serve to make more prominent.

The back-geared type head is 12 in. long, and is constructed with adjustable journals, the front one being 2 in. long and 2 1/32 in. in diameter. The base of the head is planed to interchange with standard Cataract bench lathe beds, and the spindle end-shake is taken up between the housings by means of a patent end shake take-up nut, thus making it practical to use ball bearing thrust. To the head has been added an auxiliary sleeve, upon which the cone pulley revolves when the back gear is used. This allows the cone pulley to have proper end shake, while the spindle remains adjusted to practically no end shake owing to the use of the ball bearing thrust. The oiling and dust cap protection are the same as for the firm's bench lathes. The cone pulley diameters are 3-1½ in., 4¾ in., and 6 in., for 1¼ in. belt, and the lathe head is designed for a safe spindle speed, of 1,500 r.p.m.

The spindle is 15½ in. long with a 1¼ in. hole clear through, and is hardened and ground. It is designed with a patent spindle nose, and is provided with a

safety locking device for three-jawed chucks and face plates so that they cannot come off while the spindle is in motion, should they be improperly put on.



Q.C.S.P. LATHE DETAIL.

The draw-back chuck has a 1 in. capacity clear through.

The bed is 52 in. long, 8¾ in. wide by 7½ in. deep and its casting weight is 230 pounds. It has one large way in front and one flat way in rear for carriage, while the centre is fitted to the standard Cataract bed. It has a much heavier tee slot than the bench lathes, consequently, turrets, milling attachments, etc., may be used by simply changing the draw bolts. A tee slot is planed in back of the bed into which the taper turning attachment "bed bracket" is locked, also the carriage gib and lock. This also admits the bracket A for extra fine feeds, the 15 in. swing connection, also the relieving attachment bracket for the driving cone pulley.

The gear box bracket is attached to the end of the bed and contains all gears excepting the one on the spindle. It is, therefore possible to change the swing of the lathe from 9 in. to 15 in., without interfering with the arrangement of the gears by simply adding the bracket B, containing two connecting gears; everything is then in readiness for feeds and thread cutting. In removing the head when changing from 9 in. to 15 in. swing, its and the raising block binding bolts pass through the oblong slots U so that it is a simple matter to put on and take off the heads without interfering with either the end gearing or the carriage. The tail stock has a bearing surface on the bed of 7 in. It has two inner and two outer angular guiding surfaces, making 2 in. of wearing surface, also two flat surfaces ⅝ in. wide, or a total wearing surface of 3¼ in. by 7 inches.

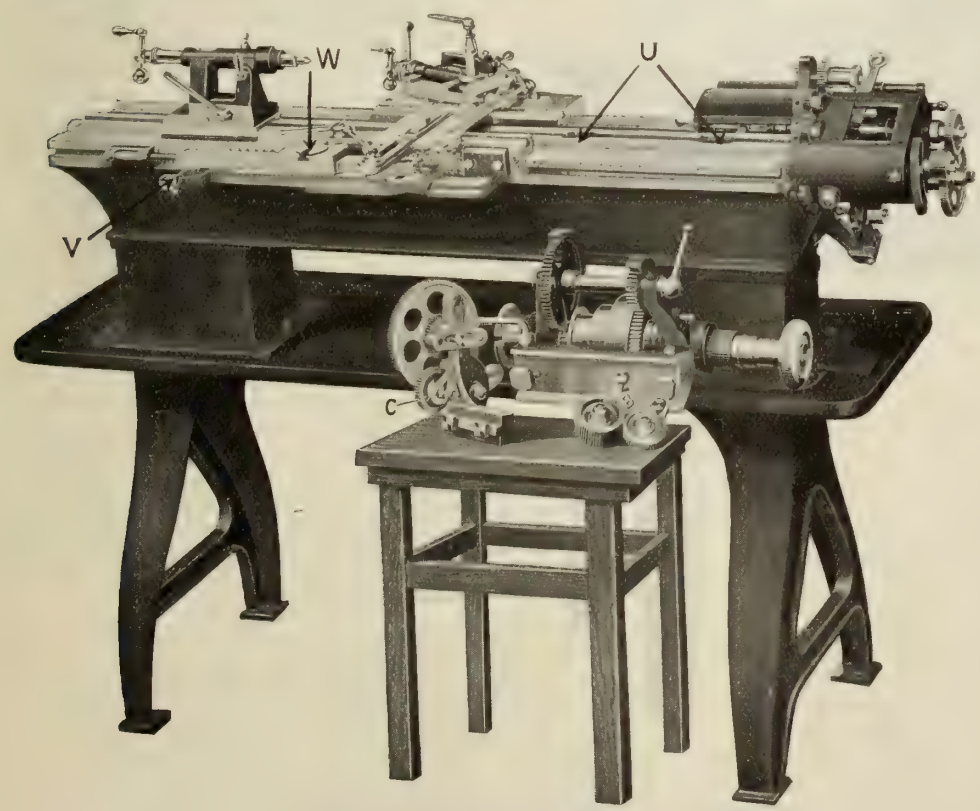
The carriage is 19½ in. long and the ways are protected by wick let into each corner by recesses cut into the carriage. Oil is thereby constantly supplied and the ways are always wiped and oiled. This method makes the wick easy to replace, besides, it can never be lost and is out of sight. The travel of the carriage is controlled by adjusting stops T and S and stop collars L and N., while a clutch eliminates the possibility of engaging the lead screw nut and feed rod simultaneously. Q. and P. are power feed controls while O represents a graduated friction vernier, which magnifies the travel of the tool four times. This makes the recessing of a hole for internal work conveniently read.

Q.C.S.P. LATHE DETAIL.

The apron mechanism is entirely encased having double bearings throughout and the oiling is carefully attended to. In all places, both in apron and gear boxes, where wear on shafts is the greatest, are hardened bushings running loosely, consequently there are two separate journals, and in case one should bind the other relieves it until it becomes lubricated. Oil wells are provided everywhere possible. The cross slide surface is 11 in. long by 4⅛ in. wide, and is fitted all over. The cross slide nut is 2½ in. long. The long slide will keep true and is in proper proportion for the 15 in. swing.

The compound slide is equipped with a quick-acting graduated nut requiring one-half revolution of the handle to advance the slide 5/32 in. to a solid stop in either direction. This will be found exceedingly convenient in cutting threads external or internal or for turning operations, and does not interfere with regular uses of compound slide screw, which, on this machine, is supplied with adjustable indexes graduated in thousands of an inch.

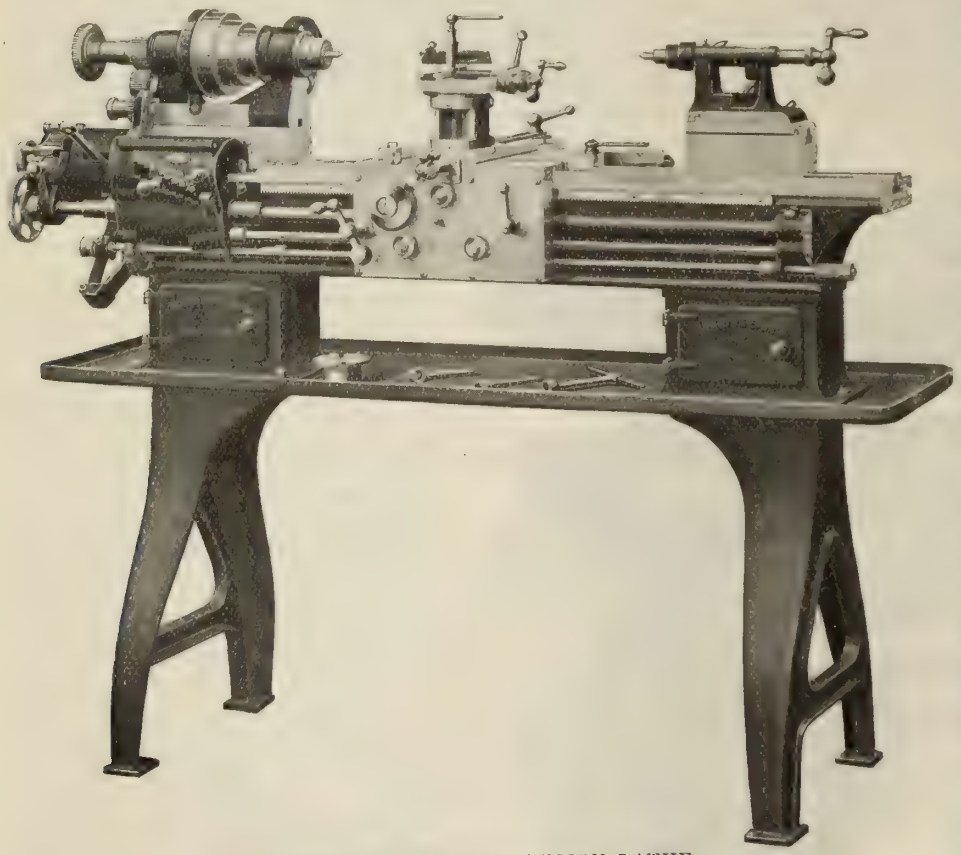
The taper turning attachment of the carriage, is constructed to be detached readily, allowing removal of the cross slide for inserting raising block bolt for compound rest. This attachment may be used on work up to 15 in. in length and is adjustable to ten degrees by a fine pitch screw. The relieving attachment is applied by using a large gear upon the patent spindle nose, which drives left or right using the spindle as an arbor, and



QUICK CHANGE SWING PRECISION LATHE.

is driven by a pinion through a set of change gears and an extra cone pulley back of lathe head, supported by a bracket held on to the lathe bed by the tee slot in the rear. This pinion operates the cam which works the cross slide to any division of the large gear desired. The cam is supported by the main bracket of the taper turning attachment and is fastened to the cross slide by the same bolt as the top slide of the taper turning attachment; thus it is easily rigged up and is suitable for relieving cutters or taps.

The change gear box consists of a nest of nine gears, 48 to 80, and through the lever manipulation, twenty-seven changes in thread are possible. Other threads are cut through different combinations of gears on stud J and screw I with lever in lock-out position, or when necessary through compounding on bracket D. All gears of 80 teeth and under are made of steel both in gear box and apron. Bracket B, attached to bracket A, is for connecting spindle gear with change gear mechanism when head is raised to 15 in. swing, and bracket C, also attached to bracket A, carries intermediate



QUICK CHANGE SWING PRECISION LATHE.

gears for connecting 2 or 3 to 1 reduction feed gear, through gear F. The regular feed of carriage is 200 per inch. The metric bracket shown is set for 10/100 m.m. pitch.

The lead screw can be replaced or exchanged in a few minutes without disturbing the change gear mechanism, and with the change gears, revolves on the roller bearings. The pitch is 6 per inch, the diameter 1 in. without a spline, and is translated constantly to 10 per inch by the gears in reversing box. The lead screw nut is 3½ in. long. The countershaft is of the 2-speed clutch pulley type, the pulleys being 7 in. in diameter by 1¾ in. face.

## RAILROAD BUILDING STATISTICS.

FOR the first time in its railroad history, the United States has been exceeded in the mileage of new railroad built during the year, according to statistics compiled by the Railway Age Gazette and published in its Annual Review.

In 1914 the total mileage of new railroads constructed in the United States was 1,531, as compared with 3,071 in 1913, while the Canadian roads built 1,978 miles, as compared with 3,010 in 1913. Not only is the total for the United States only about half of that for the year before, but it is the lowest for any year since 1895, and only about 25 per cent. of that for 1902, the high record year.

Cars and locomotives were built in the United States as follows: Freight, 104,541, against 207,684 in 1913; passenger, 3,691, against 3,296; locomotives, 2,235, against 5,332. The number of cars ordered is lower than for any year since 1901, except 1908, when only 62,669 freight cars and 1,319 passenger cars were ordered. The number of locomotives ordered was also less than for any year since 1908.

On December 31, 1914, 21,048 miles of road, with a total funded debt of $830,728,790, and a total capital stock of $434,599,738, were in the hands of receivers. In no year since 1896 has there been so great a mileage of U. S. roads in the hands of receivers.

The number of men employed on twenty rialroads on June 30, 1914, was 809,929, a reduction of 69,563, or 7.9 per cent. On August 1, 1914, the number was 764,827, a reduction of 90,934, or 10.8 per cent. from the similar date the year before. The total number of employees in thirty-four railroad supply companies in December, 1914, was 32,266, a reduction of 57,378 from the normal force, or 64 per cent.

## ONTARIO WORKMEN'S COMPENSATION ACT.

THE Ontario Gazette contains the undermentioned announcement respecting the Workmen's Compensation Act of the Province of Ontario: The Workmen's Compensation Board hereby makes the following regulation:—

51—Any employer failing to pay assessment or special assessment, or any prescribed portion thereof, within fifteen days after notice thereof has been mailed to him by registered post, shall pay as a penalty for such default 5 per cent. of the amount unpaid; and, where default continues longer than one month after the expiration of such fifteen days, shall also pay as further penalty an additional one per cent. of such amount for each calendar month or fraction thereof such longer default continues. The regulation is approved by the Lieutenant-Governor in Council.

The Workmen's Compensation Board adopted the above regulation so as to provide a slight penalty for those employers who deliberately held back payment of their assessments, and thereby injured the proper operation of the Act. The Board wants to have all assessments paid promptly, either on the instalment option or in full, by the time such payment expires.

**Want Own Accident Act.**—Ontario lumber mill operators are apparently not satisfied with the provisions of the new Workmen's Compensation Act, and have applied for a charter to form an Accident Prevention Association of their own, under the provisions of the new Act. A meeting may be held by the mill men shortly, in order to get suggestions for amendments into shape. W. E. Rigwood and Walter E. Laidlaw are Toronto representatives on the committee.

## AN OPPORTUNITY FOR MACHINE TOOL BUILDERS.

RECENT statistics show that the greatest number of articles of machine shop output have been produced by turret lathes, and that the greatest amount by weight has been turned out by boring mills. This, of course, refers to the United States more than to Canada, and probably is not the condition in the latter country. Both these tools are developments of the ordinary lathe and have reached such a stage of perfection that their output is of the highest order in comparison to the amount of labor required of any other machine tool.

Neither of these machines are made in Canada, therefore, the particular class of work to which they are eminently adapted must be done at a serious disadvantage or the machines imported to produce it. There seems, however, to be no logical reason why they should be more difficult to build than many others that are successfully made and sold, and whose demand cannot possibly show an equivalent increase in comparison with those whose advantages are that they not only produce in greater quantity and of superior quality, but are such that less expensive labor can be utilized on repetition work.

Canada is rapidly becoming a manufacturing country and the manufacturing type of machine tools are likely to be more generally required, comparatively with those of the jobbing type.

## ADVERTISEMENTS AS EDUCATIONAL HELPS.

HOW often do we meet a mechanic whose greatest ambition is to send his boy to college and thus open up for him opportunities which did not exist in his the father's time. The boy, after having passed through the University, finds, however, that the value of technical education in itself was greatly over-estimated by his father and that its worth depends largely upon its ability to assist him in securing a practical education. He finds that his usefulness to an employer who needs an executive is measured largely by his knowledge of the comparative value of different brands of packing, the characteristics of similar machine tools built by different manufacturers, and other such facts.

The mechanic of to-day has a splendid opportunity to acquire the education that will be envied him by the purely college bred man, and one source of such learning is the advertising section of the better class technical journals. A comparison of the current numbers with those of but a few years ago cannot fail to convince one of the vast increase in educative value which they now contain. Those responsible for product publicity are realizing more and more that to serve their purpose, advertisements must be attractive, and to fully attain this condition, they must be instructive. In a valuable paper presented before the University of Toronto Engineering Society, it was admitted that a large number of the illustrations accompanying the paper were obtained from the advertising columns of periodicals.

The crusade against fallacious advertising as evidenced at recent conventions of technical and trade journalists and newspapermen, indicates a determination to make the advertising section reliable, attractive and instructive to the reader besides being supplementary to the editorial columns. Endeavor is being made not only to make known the existence of the advertised articles but to educate the public in the best methods of using them. Thousands of dollars are being spent weekly in making photographs and in preparing data. Advertisements of machine tools not only illustrate the latest types of this specialty, but feature as well the different types of accessory equipment and tool set-ups, and those of other specialties are equally pronounced along the lines indicated.

It is true that the majority of advertisements have not yet reached the highest stage of educative value but where this is lacking, the advertisers are usually glad to furnish the fullest information on request. In this as well as in all other reading matter it is of course necessary to separate the wheat from the chaff, but the field even now is white to the harvest, and the information to be gained is of the kind that distinguishes between man and man.

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

**Montreal, Que., Jan. 11, 1915.**—The last week has witnessed a revival of business in all lines after the period of holiday dullness. Metals have been particularly active, the tendency to stiffen in price being a feature. On account of the present controversy between the United States and Great Britain, copper has been brought into the limelight, and a sharp rise in price is the result. The steel interests report an increase in business, and everywhere there seems to be an optimistic spirit prevailing. The iron ore and pig iron business is still very slack, but other industries seem to be holding their own.

The influence of the war has reduced the purchasing power of the larger institutions to an extraordinary extent, necessitating economy being practised in every way possible. The very best that is in us is, however, being brought out by these strenuous days and, with the return of normal times, our manufacturing enterprises will be found to have become established on a firmer and more substantial basis than ever before. As with everything else in the world worth having, we must, however, pay the price.

### The Steel Market.

The railroads of the United States have been placing more or less business lately with the steel companies, the orders being a direct result of the five per cent. increase in freight rates. The oders consist largely of rails and freight cars. A number of new locomotives are also on order. In Canada, this freight rate increase has not resulted in any actual business, but it has greatly stimulated the number of inquiries received, and it is only reasonable to assume that some of these inquiries will have favorable results.

The Allies still continue to place extensive orders for munitions of war with Canadian firms. Production of the necessary forgings has been allotted to our various steel companies, while the machining of the shells has been quite largely distributed. There is not much doing in machinery steel, but structural material is moving a little more freely than for some weeks past.

### Pig Iron.

Very little business is moving in the iron ore and pig iron business; prices have, however, been maintained.

### Machine Tools

Business in machine tools continues to be very quiet, sales since the beginning of the year having been very light. It is expected that business will pick up as the spring approaches. Supplies are moving freely, although the sales are usually of the small lot variety.

### Metals.

Copper trading has excited a great deal of interest of late and, in consequence of an increased demand, the price has stiffened and everything seems to point to a further advance. Spelter, too, has taken an upward jump. The market in tin has been rather inactive and no change in price has occurred.

The price of lead has dropped a little due to overproduction. The belligerent nations are not apparently consuming as much lead in their ammunition as was previously consumed by industries which have had to cease operating on account of the results of the war. Thus, the overproduction is reducing the price. Antimony experienced a little stiffening during the week.

More or less activity continues to prevail in the metal markets as we go to press, and further changes are anticipated during the present week.

---

**Toronto, Ont., Jan. 12, 1915.**—There has been considerable dullness in business circles during the week and this is likely to continue for some time to come. This month and February are usually quiet periods, but they will be more so this year. The spring should, however, see an improvement in the outlook. Many industries are quiet and the general tendency to economize is naturally restricting the volume of business. An improvement can hardly be expected until the war outlook brightens and optimism becomes more in evidence. Most people are confident in the ultimate return of prosperity, but it is the uncertain outlook for the immediate future that is having a depressing effect on business. There is no lack of Government orders for war equipment, which helps to relieve the situation in some industries. These orders will no doubt continue to be placed for some time to come so a certain amount of business is assured. There is in addition the prospect of other industries being benefited as a result of the war. This latter phase of the situation will take a longer time to develop, but will perhaps be more permanent in its effect.

The shortage of shipping has caused a big advance in ocean freight rates; these in some cases having gone up over 50 per cent. The falling off in ocean traffic, particularly in the import trade, will make the increase in freights not so much of a burden as would otherwise be the case. A new and higher tariff has been agreed to by the U. S. Interstate Commerce Commission which will affect goods coming into Canada from the States. Manufacturing and mercantile interests are protesting and the matter is under advisement by the Dominion Railway Commission insofar as it affects Canadian interests.

There is considerable activity in machine tools on account of developments in the shell industry. The steel trade is quiet and prices are unchanged, but firmer. The scrap metal market is stagnant, very little business being done, with prices stationary. The demand for pig iron is light and prices unchanged. The metal markets are quiet, and consumers are buying only to fill immediate requirements which are light: prices are unchanged but firmer.

### Steel Market.

Dullness has marked the iron and steel trade this week and it is too early in the year to expect any noticeable improvement, especially under the present conditions. The building trade continues very slow and is likely to remain so for some time to come, that is, until financial conditions improve materially. There is practically no railroad construction being undertaken and structural steel plants are quiet. This is a not unusual seasonal state of affairs, although this year it is more accentuated. A few contracts are being made by manufacturing interests, but immediate requirements are not heavy. The chief item of interest in the steel trade is shell manufacture, and it has been stated that the amount of this business depends entirely upon the ability of our plants to produce. Satisfactory progress is being made and large orders are being placed.

The general tone in the steel market in the United States shows continued improvement and prices on bars, plates and shapes have stiffened. Prices locally are unchanged but firmer. The Steel Company of Canada recently started another open hearth furnace at Hamilton and the Algoma Steel Co. of Sault Ste. Marie has booked an order for 15,000 tons of rails for a U. S. road at a price lower than the market level there.

### Pig Iron.

There is little to be said with regard to pig iron, as the market is so dull. Most foundries have started operations again after the holidays but as a rule on short time; their requirements, therefore, are not heavy. There has been no change in prices this week.

### Machine Tools.

There is a certain liveliness in machine tool circles over the new shell industry, but for which business would be very dull. In the majority of cases, firms taking orders for shells have to buy suitable tools to ensure rapid production and accurate workmanship. The number of firms engaged upon the work is increasing, and with it the demand for tools, which consist principally of turret lathes, grinders, hydraulic presses for the copper rotating bands, and furnaces for the heat treatment. A number of orders for equipment have been placed and others are pending. The demand for machine shop and mill supplies is light, orders generally being in small lots for immediate requirements.

### Metals.

Business locally is very quiet in the metal markets, many consumers are operating on short time and their requirements are consequently light. There has been no change in prices but there is a firmer tone throughout. The copper situation is improving and the market is strong with a prospect of higher prices. The present price is 13½c to 14c per pound. There is an optimistic feeling in the tin market which is firm at advanced prices in London. The price here, however, is unchanged at 36c per pound. Spelter is firm at 6c and lead quiet at 5c per pound. There appears to be a world-wide scarcity of antimony which has caused an advance in the New York market; the price locally, however, is firm at 18c per pound. Aluminum is unchanged at 22c per pound.

---

## CANADA AS A WHEAT PRODUCER.

ONE year ago Canada was fifth in rank among the wheat-producing nations of the world. This year she surrendered her place to Italy, who stood sixth in 1913, Canada being sixth in 1914, with 158,000,000 bushels, compared with Italy's 169,442,000 bushels.

In 1914 the United States led the world in production by a margin of 111,000,000 bushels, Russia coming second with 781,000,000 bushels. The first seven producers other than Canada in order of rank follow:

| | 1914. | 1913. |
|---|---|---|
| United States | 891,950,000 | 763,380,000 |
| Russia | 781,000,000 | 962,587,000 |
| British India | 313,040,000 | 356,864,000 |
| France | 295,000,000 | 321,571,000 |
| Italy | 169,442,000 | 214,405,000 |
| Hungary | 125,000,000 | 151,348,000 |
| Argentina* | 113,717,000 | 198,414,000 |

*Broomhall's estimate 1913-14 crop.

# TRADE AND COMMERCE RECORD

Dealing With the Steps Being Taken and Progress Made by Industrial Canada To Achieve and Maintain a Dominant Place in the Markets of the World

## MACHINE TOOLS IN TRINIDAD.

A RECENT British trade report states that machine tools are used to a considerable extent in Trinidad, possibly as much as in most agricultural countries where there is no general manufacturing. Such tools will be found principally in the automobile garages, the Port of Spain foundries, the Trinidad Government drydocks and workshops, the shops of the Trinidad Government railway, the Trinidad Electric Co., three furniture factories, one carriage factory, two lumber mills, on the large sugar-manufacturing estates, and in the shops of the asphalt and oil companies.

A large proportion of the machine tools are imported from the United States, although some are brought from England and Germany. The market for such tools is good, although limited. With the prospective development in the oil industry, it may reasonably be expected to increase considerably in the near future. Some lines of tools are ordered through travelling salesmen, and some direct from the manufacturers, but the sales are usually made through New York commission houses. Tools are mostly imported by a few houses who wholesale to country districts or retail to meet the demands, as items in a general trade, without commission, discount, or special terms of sale. There is very little attention given to advertising to advance sales in such goods. Machine tools are now imported and carried in stock by four Port of Spain firms, and used by over a dozen. Some of the users of such tools import them direct.

## RUSSIAN AGRICULTURAL MACHINERY MARKET.

SINCE the middle of August last, says a U. S. consular report, the imports of agricultural machinery into Russia have almost entirely ceased. Through northern Finland occasional small shipments, mainly of harvesting machines, come in. They are all made in Sweden by Swedish firms and by the branch house of an American concern. In the future Russia will be able to get, via Norway, Sweden and Finland, complex steam threshers and engines from England, harvesting machines and disc harrows from the United States, and harvesting machinery from Canada.

It does not seem probable that any agricultural machines will come in via Archangel, as through that port there enters principally raw metal and coal. During the month of July agricultural machinery was brought in through the Black Sea ports. The only route that remains is via Vladivostock, through Siberia and Nikolaiefsk, on the Amur, but such transportation is difficult because of the high rate of insurance, the high cost of freight through Siberia, and the question of credit, which applies to all routes. The following table shows the decrease in imports of agricultural machinery in July last, as compared with July, 1912 and 1913:

| Articles. | 1912. | 1913. | 1914. |
|---|---|---|---|
| Machines for tilling | $ 186,000 | $ 287,000 | $101,000 |
| Drills | 190,000 | 99,000 | 6,000 |
| Harvesting machinery | 78,000 | 196,000 | 21,000 |
| Thrashers | 695,000 | 728,000 | 222,000 |
| Grain cleaners and sorters | 41,000 | 63,000 | 15,000 |
| Fodder machines. | 42,000 | 28,000 | 500 |
| Motors | 695,000 | 741,000 | 285,000 |
| Other articles | 391,000 | 521,000 | 168,000 |
| Total | $2,318,000 | $2,663,000 | $818,500 |

In the first half of 1914 there was an increased importation of agricultural machines and implements in the following custom house groupings: "Other machines," tilling machinery, and grain cleaners and sorters. The first group represents "agricultural machinery not specially designated by the customs," of which the following imports are recorded: Six months of 1914, $2,678,000; of 1913, $1,854,000; of 1912, $1,390,500.

## OPPOSITION TO FREIGHT RATE ADVANCE.

IT is more than likely that many of the large mercantile and manufacturing establishments of the Dominion will be represented at a hearing of the Dominion Railway Commission, the date for which has not yet been fixed, to protest vigorously against the new freight rate schedule granted by the Inter-State Commerce Commission to eastern railways. The new tariffs are in accordance with the five per cent. increase granted by the United States Commission and will become effective on January 15. Canadian business men state that their grievance is owing to provisions made in the schedule with regard to rates from United States points to Canada. It is said that the new rates are not in conformity with those recently acquiesced in by the United States and Canadian Commissions.

The Traffic Department of the Toronto Board of Trade, members of the Canadian Manufacturers' Association, and similar organizations throughout the Dominion are taking the matter up, and unified action on their part when the Dominion Railway Commission considers the schedule is likely.

Under the new schedule, the rate to Canadian destinations, first class, from New York, will range from 59.9 cents to 78.8 cents a hundred pounds, and it will be the same from Baltimore and Philadelphia. From Albany to Canadian points the first-class rate will change from 41.1 cents to 63 cents, and from Syracuse and Rochester from 41.9 to 55.5 cents.

The tariffs provide that from New York to all Canadian points via People's Line Steamers and rail via Rouse's Point, N.Y., not less than standard all-rail rates shall apply. To points taking higher than 78 per cent. of the class rates in traffic moving by way of Long Island Sound, New London, Conn., Boston or Portland, Maine, a differential of 8 cents a hundred pounds lower than the standard all-rail rate is established, with proportionately lower differentials on other classes.

## BRITISH COLUMBIA DEVELOPMENT

MORE than $26,000,000 were spent in British Columbia in 1914 on railway construction according to an announcement by Sir Richard McBride. On the Canadian Northern, the expenditure was $8,195,000; on the Pacific Great Eastern, $12,885,000, and on the Kettle Valley, $5,000,000.

The output of British Columbia's mines in 1914 is estimated at $26,500,000, which represent a falling-off of about $4,000,000 over 1913. A million and a quarter of this loss is accounted for by the lower price of metals. Dividends of the mining companies of the Province have been $1,690,000 in 1914 as against $2,400,000 in 1913, and $465,000 more than in 1912. The Premier considers that taking the war into account this is a remarkable showing. The coal mines of the Island are now producing 6,750 tons per day which is 61 per cent. of the capacity.

The timber business has suffered from general trade depression as well as from the results of the war. However, a remarkable stimulus has been given to the pulp and paper business which the Government has been endeavoring for years past to develop. The mills at Powell River and Howe Sound have been flooded with orders from Aus-

tralia, New Zealand, South America, Japan and the Atlantic seaboard, the only unfavorable condition being the serious shortage of available shipping and the disturbances of freight rates caused by the war. The forest revenue for 1914 exceeded $2,000,000.

The last year was a banner one for fisheries. It saw the largest salmon pack for an "off-year" on record—1,100,000 cases. The total production of all kinds of fish was over $15,000,000.

Agricultural products worth $27,360,000 were grown in British Columbia last year, an increase of $3,185,000. In orchards, the area producing fruit has grown from 8,100 acres in 1900 to 38,200 to-day.

## RUBBER EMBARGO LIFTED.

CONDITIONS under which Great Britain proposes to permit American manufacturers and dealers to import rubber from England and her Colonies were announced on Jan. 8 by the British Embassy at Washington. Guarantees with bonds in cases of large shipments will be required that the rubber will not be re-exported in any form to European countries except through the United Kingdom. Following is the Embassy statement:

"Arrangements have been practically completed whereby dealers and manufacturers in the United States can obtain supplies of rubber from the British Empire.

"Manufacturers wishing to obtain large shipments will be required to give a bond through their agent in London. In other cases shipments will be allowed to approved manufacturers and dealers who signify their willingness to sign appropriate guarantees. Shipments will be addressed to a bank in New York, who will not deliver rubber until purchaser has signed and deposited guarantee with his Majesty's Consul-General at New York, and he sanctions delivery.

"Manufacturers' guarantee will be an undertaking not to export any raw waste or reclaimed rubber except to United Kingdom or British Possessions."

## NICKEL AND THE WAR.

THE world's production of nickel during recent years has been steadily increasing, as shown by the following figures in Engineering:—

| | Tons | Tons Increase |
|---|---|---|
| 1913 ..... | 30,000 | 1,500 |
| 1912 ..... | 28,500 | 4,000 |
| 1911 ..... | 24,500 | 4,400 |
| 1910 ..... | 20,100 | ..... |

During the last six or seven years there has been a remarkable expansion in the industrial uses of metallic nickel. Two-thirds of the world's supply is produced in Canada; the remaining third comes from New Caledonia and is controlled by France. The Canadian nickel deposits differ from the German potash deposits in so far as the latter appear to have been no competing sources of supply; the former has no such monopoly. The Canadian contraband of war prohibition will act as an incentive to the opening out of new deposits and re-opening of old ones, several of which are situated in the United States, Greece, and other countries, all well known.

### Norwegian Nickel Deposits.

Norway possesses extensive deposits of nickel ore, much of it containing as high as 2 per cent. of the metal. In former years nickel-mining was of some importance there, but competition with the richer ores of Canada and of some mines now shut down in the United States, could not be maintained, and most of the mines ceased operation. Towards the end of the last century the annual production of nickel sank to 7

## EQUIPMENT FOR VICTORIAN RAILWAYS.

**Tender forms and specifications have been received by the Department of Trade and Commerce, Ottawa, from Commissioner D. H. Ross. Melbuorne, for equipment required by the Victorian Railways. Particulars of the requirements, together with the date on which the tenders close at Melbourne, are briefly outlined thus:—**

**28,108, Frebruary 17, 1915.—1 horizontal hollow chisel mortiser with chisels, tools and accessories.**

**28,119, February 17, 1915.—5,000 carbons for arc lamps.**

**27,846, February 24, 1915.—1-12½-inch gap lathe and accessories.**

**27,847, February 24, 1915.—1 single head pipe screwing machine including tools, gears and accessories.**

**27,848, February 24, 1915.—1 car journal burnishing machine, etc.**

**27,849, February 24, 1915.—1-5 cwt. pneumatic hammer and accessories.**

**27,850, February 24, 1915.—1-5 feet high speed motor driven radial drilling machine and accessories.**

**27,851, February 24, 1915.—1 double wheel lathe, including tools, gears and accessories.**

**27,852, February 24, 1915.—1 horizontal milling machine and accessories.**

**27,853, February 24, 1915.—1 double ended punching and shearing machine and accessories.**

**27,854, February 24, 1915.—2 pneumatic hand riveting hammers and accessories.**

**27,855, February 24, 1915.—1 pneumatic drill (Thor Class E).**
**1 pneumatic drill (Little Giant No. 3) including tools and accessories.**

**27,856, February 24, 1915.—1 grindstone, including tools, gears and accessories.**

**27,857, February 24, 1915.—1 shaping machine (single head) and accessories.**

**27,858, February 24, 1915.—1-2-inch single head bolt screwing machine, and accessories.**

**27,859, February 24, 1915.—1 self-acting power hack sawing machine including tools, gears and accessories.**

**27,860, February 24, 1915.—1 duplex boring and turning machine and accessories.**

**27,861, February 24, 1915.—1 8½-inch gap lathe, including tools, gears and accessories.**

**27,862, February 24, 1915.—2 wet tool grinding machines and accessories.**

**27,863, February 24, 1915.—1 twist drill grinder (wet), including tools, gears and accessories.**

**27,864, February 24, 1915.—2 upright drilling machines and accessories.**

**27,865, February 24, 1915.—1-16-inch lever feed high speed vertical drill, and accessories.**

**27,866, February 24, 1915.—2 air compressors, complete, with tools and accessories, and spares.**

**27,867, February 24, 1915.—1-8½-inch brass finisher's lathe, with accessories.**

**27,868, February 24, 1915.—2 pneumatic hand draft power moulding machines, and accessories.**

**27,869, February 24, 1915.—1 magnetic cleaning machine (for brass or other metal turnings), and accessories.**

**The last available mail from Canada is that leaving Vancouver on January 19 and due at Melbourne on February 14.**

tons. It is now stated that the mines have been reopened.

On a small scale the Norwegian nickel ore-mining industry was revived some years ago, with an annual output of 70 to 100 tons, nearly all of which is used within the kingdom; one mine was worked at Eije with an ore output of 5,770 tons, producing 58.27 tons of nickel. In the smelting works 2.77 tons of matte is obtained from 100 tons of ore, and this contains 40 per cent. of nickel and 25 per cent. of copper. It is refined in the electrolytic works at Christiansand, which are equipped for an annual production of over 400 tons of the metal. The production of electrolytic nickel is a much more complicated operation than are those yielding aluminium or sodium. The electrolytic nickel has a high degree of purity, and is fairly compact. The total consumption of electricity is relatively large, and the process can be employed with advantage only where the cost of the current is exceptionally low, as is the case in Norway.

### U S. Nickel Deposits.

The United States may be considered a non-producer of nickel, although a very limited recovery of this metal is made as a by-product in the electrolytic refining of copper. The States depend practically entirely on the nickel-ore mines of Sudbury, Ont., for their supplies of the metal. The production of the Sudbury mines during 1913 reached 750,000 tons of ore, most of which was smelted to matte containing about 24,000 tons of nickel. In 1912 the production of these mines amounted to 737,320 tons of ore, whilst the matte produced 22,421 tons of nickel. There are several important companies associated with this industry: —The International Nickel Company, the Mond Nickel Company; the British-American Nickel Company was engaged also early last year. The New Caledonian mines output of ore in 1913 was 75,300 tons, and 6,000 tons of matte.

### Canadian Deposits.

The Canadian output during the last three years has been as follows:—

| | Lb. | Tons. | £ |
|---|---|---|---|
| 1913 .... | 49 676,722 | 22,177 | 3.104,800 |
| 1912 .... | 44.841.542 | 20,018 | 2.802,600 |
| 1911 .... | 34,098,744 | 15,222 | 2,132,171 |

The Ontario deposits occur in a saucer-like arrangement of rocks of volcanic character, 35 miles across one way and 15 miles the other. The mines are grouped along the outer edge of the saucer, most of them near Sudbury on the south-east side. The central portion of the saucer is filled in with non-metallic rocks, in this case sandstones and slates. It was stated about fifteen months ago that nickel properties near Sudbury were sold to French capitalists for £1,875,000, but that a very large outlay of capital would be necessary to obtain an output. It is believed that the International Nickel Co. has spent approximately £2,-083,000 in the development of its Sudbury mines.

For the purpose of obtaining the nickel output given above, it was necessary to mine and treat 823,403 tons of nickel-copper ore during 1913 and 725,-065 tons during 1912. The companies turning out these ore are the Mond Nickel Co., the Canadian Copper Co., also owning smelters, and the Dominion Nickel Co. The quantity of Bessemer nickel-copper matte shipped out of Canada in 1913 was 47,150 tons, as compared with 41,925 tons during 1912. This matte carries small gold and silver values, as well as metals of the platinum group.

Considerable changes have been made in some of the details of smelting practice, although the general method remains the same—that is, the ore is roasted, smelted, and converted to a Bessemer matte, containing from 77 to 82 per cent. of the combined metals, copper and nickel, the matte being shipped to Great Britain and the United States for refining. The quantity coming to the former is, however extremely limited. Britain imported nickel oxide from the United States in the following small quantities:

| | Cwt. | £ |
|---|---|---|
| 1913 ..... | 17,965 | 90,120 |
| 1912 ..... | 23,679 | 116,975 |
| 1911 ..... | 15,117 | 74,310 |
| 1910 ..... | 17,294 | 86,135 |
| 1909 ..... | 19,455 | 96,325 |

A portion of the matte made by the Canadian Copper Company is used for the direct production of monel metal, an alloy of nickel and copper, without the intermediate refining of either metal. Of the metallic output of Canada, nickel is second in quantity and third in value, as shown below:—

| | | £ |
|---|---|---|
| Nickel ..... | 49 676,770 lb. | 3,104,800 |
| Copper .. ... | 76,975,820 lb. | 2,448,600 |
| Silver ... ... | 31,750,618 oz. | 3,955,000 |
| Gold ..... .. | 784,525 oz. | 3,378,300 |
| Lead ... .... | 37,662,700 lb. | 365,500 |

The Province of Ontario has the largest mineral production, 40.75 per cent.; British Columbia coming next with nearly 20 per cent., and Nova Scotia third with 13.40 per cent. The output of the other six provinces is very limited, in no case reaching 10 per cent.

**The Canada Producer and Gas Engine Co.**, Barrie, Ont., received an order for fifty 50-h.p. 3-cylinder gasoline engines for motor tractors for a firm in Plessisville, Que.

### NEW BRUNSWICK DEAL TRADE.

THE shipments of deals, etc., from St. John to trans-Atlantic ports in 1914 were larger than in either of the two preceding years, but from the province generally the shipments were smaller than for several years past. There were no trans-Atlantic shipments from Richibucto, outports of Sackville, or Albert, or Bathurst, as in 1913, did not send any cargoes across the ocean. Considering conditions in the last five months, however, the business done must be considered reasonably good. The following is a statement of the shipments from St. John for 1913 and 1914:

| | |
|---|---|
| Total, 1913 ..... | 86,538,622 |
| Total, 1914 ..... | 91,679,007 |

A recapitulation of the shipments from the various provincial ports gives the following total for the year, compared with three previous years:

| Year. | Deals, etc. Sup. feet. |
|---|---|
| 1911 ..... | 285,981,379 |
| 1912 ..... | 245,806,682 |
| 1913 ..... | 270,963,621 |
| 1914 ..... | 217,906,813 |

Good prices prevail in the British markets, and although freights are high, lumber dealers are likely to do well.

### OWEN SOUND, ONT.

BUSINESS activity in the city of Owen Sound is being well maintained during these times of general depression, the factories nearly all operating on full time. Government work is proceeding normally and considerable residence and business building is being done.

The Wm. Kennedy & Sons Co. have built a large two-storey stone addition to their steel foundry. The city has begun the construction of permanent concrete roadways, four blocks having been completed this fall. This work will be continued in the spring as weather permits. The Taylor & Pringle Co. have under consideration a large addition to their pickle and vinegar factory.

Hydro-electric development is proceeding at Eugenia Falls and the Commission expect to have the transmission line and distribution system completed during the coming summer, which will provide abundance of electrical energy for all purposes. A street railway is also under consideration, and is expected to materialize as power becomes available.

The Dominion Government has spent large sums of money during the last year on concrete docks and harbor works. These are expected to be proceeded with on the opening of navigation in 1915. Quite a large number of new dwellings have been built during 1914 and there are very few vacant houses.

# INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.: Municipal Undertakings; Mining News

## Engineering

**Stratford, Ont.**—It is reported here that the G. T. R. have received an order for 10,000 shell parts.

**Stamford, Ont.**—The township council are in the market for a 1½-ton hand-operated traveling crane.

**Regina, Sask.**—It is announced that the Coste-McAulay syndicate will resume operations in the spring on drilling for natural gas.

**Berlin, Ont.**—The Canadian Buffalo Forge Co. has secured an order for 5,000 eighteen-pound shells for the Russian Government. This will necessitate the adding of additional facilities, and three shifts of men will be necessary.

**Cobourg, Ont.**—A by-law authorizing the issue of debentures for the raising of $50,000 in aid of the Federal Steel & Foundry Co., Ltd., for the establishment of a manufactory of steel and iron products, forgings and castings has been carried by a vote of 572 to 90.

## Municipal

**Essex, Ont.**—The council are considering the purchase of a steam pump and boiler.

**Saanich, B.C.**—The municipality are contemplating installing a waterworks system.

**Hamilton, Ont.**—An expenditure of $110,000 on waterworks improvements is contemplated. A by-law will be voted on.

**Ottawa, Ont.**—The City Council will call tenders in the near future for a supply of brass castings for the waterworks department.

**Fredericton, N.B.**—Chief H. C. Rutter of the fire department, has recommended the purchase of a motor combination chemical hose truck and a motor ladder truck.

**Hespeler, Ont.**—The citizens voted on a $35,000 by-law on Jan. 4, for waterworks. It was passed by a majority of 30.

**Montreal, Que.**—The city proposes to spend $3,934,966.21 this year on new permanent paving, sidewalks, repairs to roads and sidewalks, street grading and on macadam.

**Wheatley, Ont.**—A by-law to grant Marvin White a 15-year franchise for supplying electric light and power to Wheatley was carried by the ratepayers by a majority of five.

**Toronto, Ont.**—Commissioner Harris has ordered three cars for the operation of the Bloor street car line. Hydro power for operation will be obtained from the station at Edwin avenue.

**Toronto, Ont.**—Quinlan & Robertson, the successful tenderers for the Bloor street viaduct, are making arrangements to start the work as soon as possible. Already considerable machinery to be used in construction has arrived.

**Wallaceburg, Ont.**—A by-law authorizing the town council to borrow $9,000 was carried on Jan. 5. The money is for the purpose of carrying on the Hydro-electric and waterworks system now being installed in Wallaceburg.

**Montreal, Que.**—Preliminary work for the foundations of the new St. Antoine market will be undertaken this spring. The new building will cost between $100,000 and $125,000. It will be fitted up in the most modern manner, and will contain a special refrigerating apparatus. Mr. Lacasse is the city architect, and J. E. A. Biron is superintendent of civic markets.

**Montreal, Que.**—The city will endeavor to borrow $5,800,000 for public improvements during the present year, according to an announcement made by Mayor Martin recently. On its increased valuation for 1914, the city can borrow over $3,000,000, while special loans which have been authorized for underground conduits, the aqueduct and other big undertakings will make up the balance of the six millions which the Mayor says will be sought.

**Montreal, Que.**—A special committee of the city council, which was appointed to enquire into the matter, have decided to recommend to Council the voting of $1,500 to complete plans for the construction of a tunnel under the Lachine Canal for the relief of traffic congestion. G. R. McLeod, the city engineer in charge of railways and bridges, in collaboration with a tunnel expert yet to be appointed, will prepare plans for the tunnel, which will be built under the canal at a point which is to be decided by the two engineers. It is suggested that Lt.-Col. H. R. Lordly be appointed to co-operate with Mr. McLeod.

## Electrical

**Brockville, Ont.**—A member of the staff of the Hydro-Electric Power Commission of Ontario was recently in Brockville consulting with the management of the Light and Power Department relative to serving the rural district west of Brockville with electrical energy. It is proposed to include in the area several Summer Resorts located along the river for a distance of seven miles. The line will be constructed by the Hydro Commission and the power supplied by the local plant. Many large farms in the district have promised to become consumers and the project is being very favorably received.

## General Industrial

**Kincardine, Ont.**—A by-law will probably be submitted to authorize a loan to the Mitchell woolen mill.

**Valleyfield, Que.**—The by-law to grant an additional bonus to Berman Bros. & Co., to establish a clothing factory has been approved by a majority of 37 votes.

**Toronto, Ont.**—Thomas Brothers have leased for a term of five years the ground and main floors of their new building on John Street, comprising 16,800 square feet, to the Automatic Box Co., for $20,000, or at the rate of $4,000 a year.

**Tilbury, Ont.**—Manager Odette, of the Canadian Top Co., has closed a number of large contracts with some of the leading automobile concerns, and he says the factory here will be running full time about the middle of this month.

**Chatham, Ont.**—It is reported that the Chatham plant of the International Harvester Co., is to be sold to the Massey-Harris Co. This may indicate a plan by the Harvester Company to give up Canadian manufacture, leaving the field open to Dominion concerns.

**Moose Jaw, Sask.**—The announcement was made last Thursday that a reorganization was in progress of the Moose Jaw Flour Mills, Ltd., and that the mill, which has been standing in a partially completed state for the past eighteen months, will be in operation in the course of the next few months. The mill was launched as a 3,000-barrel concern in 1912 by local men, but financial

difficulties have stood in the way, and the building, while complete, has been without machinery. New blood has been interested in the company, and a successful completion of the project is expected.

**Windsor, Ont.**—The Canadian Canners have purchased the Morand Canning factory at Tecumseh, and are asking the township of Sandwich East, for exemption from taxation. The same company is said to have purchased the McGregor factory.

## Tenders

**Calgary, Alta.**—Tenders will be received up to February 12, 1915, for the furnishing and erecting of steel superstructure for Louise Bridge at 9th St. West. Plans, specifications and information may be obtained from the city engineer's office, upon making a deposit of $5.

**Toronto, Ont.**—Tenders will be received at this department until Monday, February 1, 1915, for the electric fixtures required for new Government House, Rosedale, Toronto. Plans and specifications can be seen at this department. H. F. MacNaughten, secretary, Public Works Department.

**Winnipeg, Man.**—Tenders will be received up to January 20, 1915, for the supply of gravel pit excavation, screening, elevating and crushing machinery; also for locomotives and cars for pit and for railway service. Specifications and form of tender may be obtained at the offices of the district. S. H. Reynolds, chairman of Commissioners.

**Toronto, Ont.**—Tenders will be received up to Tuesday, Feb. 2, 1915, for the supply and delivery to the Street Cleaning Department of 100 (more or less) loose paper can receptacles, as may be required. Specifications may be seen and form of tender obtained, together with all information relative thereto, at the office of the Street Cleaning Department, City Hall, Toronto.

**Toronto, Ont.**—Tenders will be received by the Chairman of the Board of Control, up to Tuesday, February 16, 1915, for supply and installation of furnaces and appurtenances for refuse incinerating plant. Specifications and tender form for the foregoing may be obtained upon application at the office of the Street Commissioner, Department of Street Cleaning, City Hall, Toronto.

**New Hamburg, Ont.**—Tenders will be received up to Wednesday, January 20, 1915, for the purchase of the real and personal property of the New Hamburg Manufacturing Co., Ltd. The plant is adapted for the manufacture of threshing machines, engines, cement mixers, etc. Full detailed particulars may be had on application to Charles J. Fox, New Hamburg, and Bissett & Peine, 24 Adelaide Street East, Toronto.

## Contracts Awarded

**St. John, N.B.**—H. Horton & Sons have received an order for 600 sets of saddles and equipment from the Russian Government.

**The Hamilton Bridge Works,** Hamilton, Ont., have been awarded the contract for the steel work in connection with the Don section of the Bloor street viaduct, Toronto, at $400,000.

**Chatham, Ont.**—At the meeting of the council, the tender of the Canadian General Electric Co. was accepted for transformers for the sub-station, the order aggregating about $20,000.

**Berlin, Ont.**—The L. McBrine Co. of this city has received an order from the Russian Government for 1,300 saddles at $72.50 each. Leather for the saddles will be furnished by the Lang Tanning Co., of this city.

**Winnipeg, Man**—Contracts have been awarded in connection with the municipal hospital to the Canadian Fairbanks-Morse Co. for a motor-driven pump, motor and forced draft fan; to the Crane Ordway Co. for traps and receivers; and to the Western Steel and Iron Co., Winnipeg, for shaking grates.

**Toronto, Ont**—The Board of Control has let the following contracts for valves and pipe: Drummond McCall & Co., three 24-in. valves at $240 each; Glenfield & Kennedy, seven 12-in. valves at $1,690; National Iron Works, Ltd., and Canadian Allis-Chalmers, Ltd., for a quantity of cast iron pipe 3 in. to 20 in.

**Fredericton, N.B.**—Hon. John Morrissy, Minister of Public Works, has awarded contracts for two bridges in Queen's County. The contract for rebuilding the Enniskillen Station bridge was awarded to W. R. Fawcett, of Temperance Vale, while the Merritt bridge will be rebuilt by Robert Forbes, of Gibson. The contract price in each case is in the vicinity of $3,000.

## New Incorporations

**The Sweatmeat Co.** has been incorporated at Ottawa with a capital of $50,000, to manufacture candies, preserves, etc., at Peterborough, Ont. G. N. Gordon, of Peterborough, is acting for the company during organization.

**The Ball Furniture Co.** has been incorporated at Ottawa, Ont., with a capital of $125,000, to manufacture chairs and furniture of all kinds at Hanover, Ont. Incorporators—R. J. Ball, M. L. Ball and John Ball, all of Hanover, Ont.

**Moyes Construction Co., Ltd.,** has been incorporated at Toronto, Ont., with a capital of $40,000, to carry on a general construction, contracting and building business at Toronto, Ont. Incorporators—R. J. Moyes, G. Stagg and F. Reeve, all of Toronto, Ont.

**The Globe Electric Machine Co., Ltd.,** has been incorporated at Toronto, Ont., with a capital of $800,000, to carry on a general engineering and machinist business at Hamilton, Ont. Incorporators—M. Buskard, S. G. Buskard, and F. Lazier, all of Hamilton, Ont.

**Eplett Mfg. Co.** has been incorporated at Ottawa, Ont., with a capital of $100,000 to manufacture paints, oils, varnishes, etc., at the village of Cumberland, Ont. Incorporators—R. K. Eplett, W. Graham and S. Karr, all of Cumberland, Ont.

**NAlbergras Oil & Gas Co.** has been incorporated, with head office at Ottawa, Ont., and a capital of $2,500,000, to carry on the business of producing and refining petroleum and petroleum products. Incorporators—T. C. Keefer, C. O. Wood and J. S. Hollinsworth, all of Ottawa, Ont.

**Manufacturing & Contracting Co. of Canada, Ltd.,** has been incorporated at Ottawa, Ont., with a capital of $150,000, to carry on a general contracting engineering and constructing business at Toronto, Ont. Incorporators—T. A. Rowan, J. E. Jones and Norman Sommerville, all of Toronto, Ont.

## Building Notes

**Toronto, Ont**—A building permit was issued on Dec. 30 to the Wm. Wrigley Co. for the addition of two storeys to their factory on Carlaw avenue, at a cost of $65,000.

**Calgary, Alta.**—R. B. Bennett, K.C., M.P., states that the work on the new armory will be started in the early spring. The plans for the building were now being prepared, and as soon as they are finished tenders will be asked on construction.

**Toronto, Ont.**—The permit for the erection of the new Provincial Hydro Power Commission's head office building on University avenue was granted by the city architect on Jan. 7. The structure will be six storeys high, and will be erected just north of the Alexandra Apartments. It will cost $75,000.

# Railways-Bridges

**Ottawa, Ont.**—Application for time extensions will be made to Parliament next session by the Canadian Western Railway Co. and the Calgary and Fernie Railway Co.

**Ottawa, Ont.**—The Athabasca, Grand Prairie and Peace River Railway Co. will apply to Parliament at its next session for an Act authorizing the company to construct and operate certain lines of railway.

**Trenton, Ont.**—Fire on Jan. 4, destroyed the old roundhouse of the C. N. R. in North Trenton. Considerable additional loss was sustained in the equipment of the shop, together with the destruction of an official car and a gas-electric passenger car. The actual damage is estimated at $100,000.

**Edmonton, Alta.**—Engineers representing the Government and the Alberta and Great Waterways railway are now going over the proposed route of the road north of Mile 174, and it is expected that plans for the final link of the line will be tendered to the Government within a few weeks.

**Dunnville, Ont.**—Jas. P. Dunne, of the Ordnance Branch of the Department of the Interior, Ottawa, has concluded negotiations for the transfer of the Naval Reserve Lands on the east side of the river at Port Maitland to the T. H. & B. Railway. The land is to be used for development purposes in connection with the T. H. & B. Railway.

**G. T. R. Cut Wages.**—Over 14,000 employees of the Grand Trunk have been notified by Howard G. Kelley, first vice-president of the road, that on account of the falling-off in business, owing to the war, they will be asked to accept a reduction in wages, dating from April 1 next. Thousands of employees on the Grand Trunk Pacific have likewise been informed by Morley Donaldson, the general manager, that they will receive a cut in pay dating from the first of this year. In both cases the reduction is to be based on the results of operation for the half-year ending December 31 last.

# Refrigeration

**Toronto, Ont.**—To further reduce the cost of maintenance at the hospitals and asylums in the province, a large abattoir will be erected on the prison farm at Guelph to take care of the meat supply required by a population of about eight thousand persons. Although the plans of the abattoir have not been completed, ground has been broken and the main lines determined. The cost of the new building will be something less than $40,000 and will have a capacity of two thousand cattle and a similar number of hogs annually.

# Wood-Working

**Hillsboro, N.B.**—The plant of the Hillsboro Woodworking Co. was destroyed by fire on December 29. The loss is estimated at $7,000, with no insurance.

**Montreal, Que.**—Gingras & David's sash and door factory at Bordeaux, near here, was totally destroyed by fire on January 9. Damage estimated at $50,000 was done.

**Halifax, N.S.**—There is a proposition under way to establish a lumber and planing mill on the Tremaine property at the North-West Arm. Charles T. T. Piercy and W. D. Cranston are interested in the scheme.

# Marine

**Windsor, Ont.**—Three veterans of the lakes, in the persons of Captain James Carney, Chief Engineer Alexander McDonald and Engineer Robert Craig, have retired and joined the superannuated list after serving the C.P.R. since the car ferry Ontario was placed in commission 25 years ago.

**C. P. R. Discontinues Ferry at Windsor.**—Independent operation of car ferries across the Detroit river between Detroit and Windsor will be discontinued by the C. P. R. on January 10. Under a new arrangement the car ferries Ontario, owned by the C. P. R., and the Pere Marquette No. 14, owned by the Pere Marquette Railroad, on and after January 10 will be operated under the joint control of the two railroads for both passenger and freight trains of each line, except the two fast passenger trains of the Canadian Pacific, running between Montreal and Chicago.

**Charts of Inland Waters** - The Naval Service Department, Ottawa, will shortly publish a complete Canadian issue of charts of the inland waters of the Dominion. A series of forty plates representing the result of several years of work already done, have been received from the Imperial authorities. The work of surveying the Great Lakes has hitherto been to a great extent done by the British Admiralty but, with the assistance of the results of its labors, the Canadian Government will now bring it much more nearly up to date. Two survey ships, La Canadienne, on Lake Superior, and the Bayfield, on Lake Ontario, are now engaged in surveying. Lake Ontario has been practically completed, and good progress has been made with the work on Lake Superior and Lake Huron.

**Ottawa, Ont.**—It is the intention of the Department of Marine to establish a uniform system of characteristic for gas-lighted buoys and gas beacons, making buoy or beacon lights that are to be left on the starboard side in going up stream occulting red lights, and port hand lights occulting white lights—that is, red buoys will carry red lights, and black buoys white lights. For special positions, such as middle grounds, and fairways, special arrangements will be made. White lights will, however, be favored when possible. It is proposed to make the changes on the opening of navigation or by May 1 next.

**Lakes Protective Association.**—The Lakes Protective Association made a very good showing in 1914, which means underwriters had a profitable season, as the association carries 25 per cent. of the insurance on the bulk of the freighters that are insured. Not one of the 19 vessels lost last season was enrolled in the Protective Association, members of which operate about 200 vessels. Only one boat in a hundred was in an accident in which there was a total loss. The steamer Caldera sank the steamer W. H. Gilbert in Lake Huron. The heaviest loss to the underwriters was the steamer Benjamin Noble, which was insured for about $120,000. Her cargo of steel rails was also insured.

# Personal

**Herbert Samuel Holt**, president of the Montreal Light, Heat & Power Co., Montreal, has been made a Knight Bachelor.

**William Hurst**, manager of the Hurst Engineering & Construction Co., Winnipeg, Man., has returned home after a short vacation at Galt, Ont.

**George Joseph Desbarats**, Deputy Minister and Comptroller of Naval Service, and formerly Deputy Minister of Marine and Fisheries, has been made a C.M.G.

**Harry Bayne** has been appointed General Agent for Canada and Newfoundland for the Safety Car Heating & Lighting Co., of New York, with offices in Montreal and Toronto.

**Arthur Hatton** has been appointed general superintendent of the C.P.R. car service, with headquarters at Montreal, to succeed George S. Cantlie, Lieut.-Col. commanding the 43rd Royal Highlanders in the third Canadian contingent for overseas service. Mr. Hatton began his connection with the C.P.R. as a telegraph

# SEE HOW EASILY THEY ARE ADJUSTED

The Thread Chasers with which the Geometric Die Heads are fitted are more easily adjusted and more easily re-ground than any other thread chaser.

## Geometric

### Screw-Cutting Die Head

**Style D**

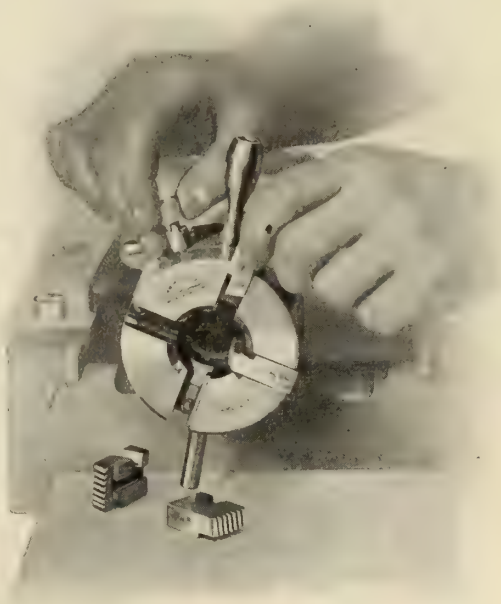
Is designed for use on the turret of hand and automatic screw machines in place of solid dies.

**A Big Money-Saver on all Screw-Threading Operations.**

Quick and accurate variations may be made in the diameter of the threads for a tight or loose-fitting screw.

The dies cannot move away from the work. Cut threads parallel with the work, requiring no pilot.

**Write for Descriptive Booklet.**



Method of removing dies or chasers.

## The Geometric Tool Company

**New Haven, Conn.**

**Canadian Agents :**

**Williams & Wilson, Ltd., Montreal.** **The A. R. Williams Machinery Co., Ltd., Toronto, Winnipeg and St. John, N.B.**

operator 23 years ago, and has been associated with the company's car service in Winnipeg.

**C. O. Stillman,** president of the Imperial Oil Co., Sarnia, Ont., has left for a trip to Peru, where he has business to transact over some new oil property belonging to the company.

**H. M. Ford,** recently at the Montreal office of the B. F. Sturtevant Co., Ltd., of Canada, has started in business for himself at 802 New Birks Building, Montreal,, and is handling Sturtevant Vacuum Cleaners.

**G. H. Howard,** who has been traveling for the A. R. Williams Machinery Co. for the past seven or eight years, has severed his connection with them to take a position on the sales staff of the John Bertram & Sons, Co. Mr. Howard will represent both the Bertram Co., and their associate the Pratt & Whitney Co., of Canada, Ltd., in the Niagara District and Western Ontario, with head quarters at Dundas.

**J. E. Rogers,** who for the past seven months has held the position of second vice-president and assistant general manager of the Russell Motor Car Co., West Toronto, has resigned to accept the position of general manager of the International Time Recording Co., with factories and head offices at Endicott, N.Y. Mr. Rogers was formerly assistant general sales manager of the National Cash Register Co., and joined the Russell staff in May last.

**G. A. Irwin** has been appointed sales manager for the Algoma Steel Corporation, and assumed his new duties at the first of the year. He has been connected with Drummond McCall & Co. for the past thirteen years, which firm have been acting as sales agents for the Algoma Steel Corporation. Mr. Irwin had charge of the sales of all the products of the Algoma Steel Corporation, and in addition had charge of the sales of iron ore and pig iron. About July 1 last year the Algoma Steel Corporation decided to sell direct, hence the opening of the Montreal sales office of which Mr. Irwin is in charge, in the McGill Building.

**Thomas Coltrin Keefer, C.E., C.M.G., LL.D**, one of Canada's most noted engineers, died at his home in Ottawa on Jan. 7. Mr. Keefer was born at Thorold, Ont., in 1821, and began his engineering career in 1836. He conducted the original surveys for the G.T.R. in 1851, and later was a strong advocate for the construction of the C.P.R. In addition to his work on railway construction, Mr. Keefer was an authority on harbors and waterworks, and was during his long career connected with many important undertakings.

# Trade Gossip

**The Bawden Machine Co.,** Toronto, has been awarded a contract for hydrants and stop valves by the Toronto Board of Control.

**F. H. Hopkins & Co.,** Montreal, dealers in railway and contractors' supplies, have opened an office in Winnipeg at 1206 Union Trust Building, in charge of J. W. Purcell.

**The Herbert Morris Crane & Hoist Co.,** Toronto, have been awarded a contract for an ash hoist for the Williamson Road School by the Board of Education, Toronto.

**Orders for Algoma Steel.**—It is reported that the Algoma Steel Co. of Sault Ste. Marie, Ont., has taken orders for 15,000 tons of rail for the United States at a price lower than the market level there.

**Joseph Bowler and H F. Bowler** have entered action at Osgoode Hall against the Toronto Structural Steel Co., Limited, for $5.000 damages for alleged negligence causing the death of John Bowler who was killed on a collapsing scaffold at Streetsville Ont.

**The Green Fuel Economizer Co.** has entered action at Osgoode Hall against the city of Toronto to recover $5,917.25 alleged due for an economizer said to have been wrongfully destroyed by the city and valued at $4,000, and $1,370 with $547.25 interest, for installing a draft fan at the city pumping station.

**Wagon Works Busy**—The employees of the Petrolia Wagon Factory started working full time last week. An order for nearly a hundred large military wagons is well under way and this has been supplemented by an order from many of the farm wagon dealers throughout Ontario.

**U. S. Exports of Copper.**—Copper exports from the United States through the principal Customs district during the week which ended December 26, amounted to 2,841,570 pounds, valued at $372,073, and for the four weeks 33,565,937 pounds, valued at $4,197,547. During the December 26 week, 1,151,581 pounds were exported to England, and 1,569,107 to Sweden.

**Orders Placed for Saddles.**—The Canadian Government Sub-committee which has been looking after the purchase of supplies in Canada for the allies has placed the order received recently from the Russian Government for twenty thousand saddles. The contract which totals up to $1,500,000 has been distributed among manufacturers of saddlery in all parts of Canada.

**More War Orders.**—Secretary Griffiths, of the High Commissioner's office, in London, has stated that on one line alone of war necessities, Canadian manufacturers may hope to receive orders from the British Government which will spread over the next six months, and will approximate in value twenty-five million dollars.

**Companies Formed in 1914.**—During the twelve months of the past calendar year, 3,500 new companies secured Dominion or Provincial charters, according to The Monetary Times Annual. The total authorized capitalization of these companies was $893,249,605. The largest number of companies was chartered during the week ended August 7, when 180 Federal and Provincial charters were granted. The largest aggregate authorized capitalization for one week was that for the week ended August 14, when the figures were $79,406,975. No less than 675 companies were incorporated in connection with the Calgary oil fields last year. They had an aggregate authorized capitalization of $351,730,000. Of these companies, 166 had authorized capital of $1,000,000 or over.

**Dominion Steel December Output.**—The business of the Dominion Steel Corporation in the closing months of the year did not show great improvement. The output for December, 1914, as compared with the previous year in all departments is as follows:

| | Dec., 1914. (Tons) | Dec., 1913. (Tons) |
|---|---|---|
| Pig iron | 12,843 | 20,535 |
| Steel ingots | 19,787 | 19,082 |
| Rails | 3,700 | 10,411 |
| Wire rods | 3,762 | 1,484 |
| Bars | 410 | 265 |
| Wire and wire products | 2,567 | 1,556 |
| Coal mined | 317,003 | 396,824 |
| Steel Shipments | 12,048 | 5,549 |
| Coal | 221,597 | 261,316 |

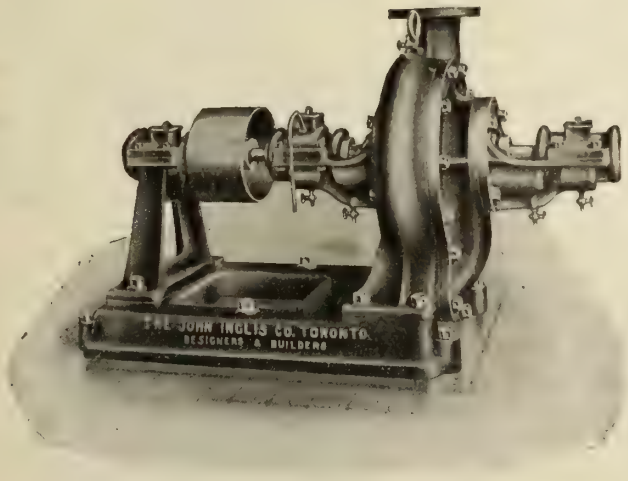
# "INGLIS"



**Horizontal Belt-Driven Turbine Pump Supplied University of Toronto**

This pump is hydraulically balanced against end thrust and in addition has a water-cooled thrust bearing. Side covers are arranged so that internal inspection is possible without breaking pipe joints.

*INGLIS PRODUCTS ARE "MADE IN CANADA"*

**The John Inglis Company, Limited** ENGINEERS AND BOILERMAKERS
14 Strachan Avenue, Toronto, Canada
BRANCHES: Montreal, Room 509 Canadian Express Building
Ottawa, J. W. Anderson, 7 Bank Street Chambers

## FOR SALE

**75 H.P. Corliss Engine.**

300 feet capacity "Fairhurst" **air compressor,** cross compound, cylinders 14" x 10" and 9" x 10" with intercooler, unloader, all complete.

"Positive" **clutch** and **pulleys,** and **shafting,** all in excellent condition.

**McIntosh Granite Co., Ltd.**
**1119 Yonge Street, Toronto**

**McKaig's Combination Pliers**

**A new invention, an improvement over the old style.**
When the cutters on other pliers get dull they won't cut. **"SURE CUTTERS" will cut perfectly, no matter how dull the edges get.**
When the hold gets loose on other pliers, they won't cut — but "SURE CUTTERS" do the work just the same.
**Try them—order now, before you forget it**

**McKaig Drop Forge Co.**
Buffalo, N.Y.

# METAL STAMPINGS

We are manufacturers of stamped parts for other manufacturers.

**We do any kind of sheet metal stamping that you require.** Our improved presses and plating plant enable us to produce the finest quality of work in a surprisingly short time.

We can finish **steel stampings in Nickel, Brass or Copper.**

**Send us a sample order.**

**W. H. BANFIELD & SONS**
**120 Adelaide St. W., Toronto**

treatise on the scientific management of boilers, published by the American Boiler Life Co., Borston, Mass, and explains the principal features of the company's boiler preservative and the chemical combination involved. The booklet also deals with the question of boiler scale, its formation and elimination.

**Cranes and Hoists.**—The Northern Crane Works, Ltd., Walkerville, Ont., is distributing a 32-page booklet descriptive of their electric traveling cranes and hoists. The purpose of the booklet is to illustrate a few of the principal types, some being shown in operation. Complete specifications and other particulars are given in separate bulletins, which can be obtained on application. Other products illustrated include hand-power cranes, jib cranes, gantries, electric hoists, etc.

**Water Softeners.**—The "Cochrane" Engineering Leaflet, No. 17, describes the Sorge-Cochrane Hot Process System for Softening Water. The leaflet, consisting of 20 pages, contains much useful information on preparation of water for steam boilers, impurities in water and their elimination, and the chemistry of water softening. A complete description is given of the Sorge-Cochrane process and the apparatus employed in connection with it, while interior views of the apparatus show clearly the general construction. The leaflet can be obtained from the Canadian Allis-Chalmers, Ltd., Toronto, Ont., who are the Canadian agents.

**Feed Water Regulators,** made by the Elliott Co., Pittsburg, Pa., are described in Bulletin No. 1, recently issued. The benefits to be derived from the use of fed water regulators are first dealt with, followed by chapters on water columns and controlling valves. The various types of feed water regulators are then described, accompanied by a dimension table and price list for each. The descriptions of the various apparatus are very complete, while with the illustrations are included sectional views showing the general construction. The bulletin concludes with a series of diagrams showing a number of typical feed water regulator installations.

**Dixon Crucible Booklet.**—In a new edition of the booklet "Dixon's Graphite Crucibles," information is furnished concerning steel melting crucibles, file crucibles, crucible covers, tilting furnace crucibles, retorts, bottom-pour crucibles, stirrers, skimmers, dippers and self-skimming crucibles. Some good advice is given in two pages relating to oil furnaces and general hints. Foundry facings and a highly refractory cement for the repair of worn or cracked firebrick are also described. This little booklet is altogether worth while to the man interested in the subject of better foundry practice, and a copy is gratis to those who take the trouble of writing the Joseph Dixon Crucible Co., Jersey City, New Jersey.

**J.-M. Sea Rings.**—The Blue Book of Facts and Figures issued by the Canadian H. W. Johns-Manville Co., Toronto, deals very thoroughly with the J.-M. Sea Rings, which are also referred to as the Ideal automatic packing. The catalogue states how this packing is made, the purposes for which it can be used, and the reasons why the different materials are employed. One illustration is of especial interest, as it shows a number of dimensioned sections with the view to drawing the reader's attention to the precision and accuracy employed in the manufacture of the packing. Other products described are the J.-M. Permanite sheet packing and flange gaskets. All the products are illustrated and views are included of the company's plants and offices.

---

# Book Reviews

**The Mechanical World Pocket Book and Year Book for 1915,** published by Emmott & Co., 65 King Street, Manchester, England. Price, 25 cents post paid. This is the twenty-eighth issue of the well-known "Mechanical World" pocket book for engineers and draftsmen. This publication gets larger and better each year, and contains a great deal of valuable information at a small cost. In this issue many new features have been introduced. The section on toothed gearing has been re-written and considerably extended, and includes some useful notes on gear cutting. More matter has been introduced dealing with structural iron and steel work. The section on the gas engine has been revised and extended, while a new section has been added dealing with limit gauges. New tables are included on the cost of power, helix angles, morse tapers, etc., and many additional illustrations have been introduced. In addition to the technical matter, 52 pages are devoted to a diary. The book is pocket size and bound in substantial cloth covers.

**Resuscitation from Mine Gases.**—Technical paper, No. 77, is used by the Bureau of Mines, Department of the Interior, Washington, D.C., embraces a report of the committee on Resuscitation from Mine Gases. The purpose of the investigation was to develop an efficient method of resuscitation, which may be administered by miners or other persons who have not had the training of a skilled physician, but frequently have to treat a fellow-workman

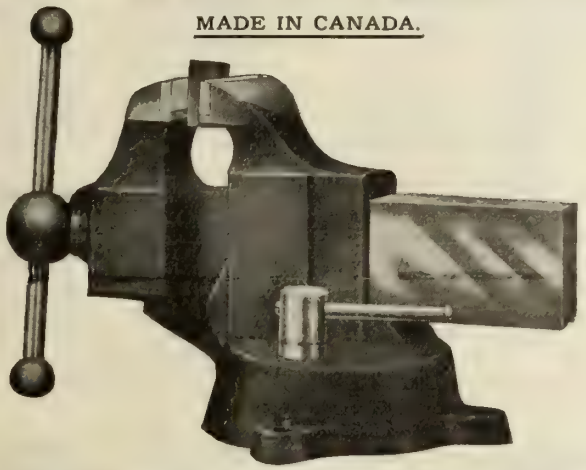
# The YOST

**Solid Jaw and Swivel Bottom Machinist's Vise**

MADE IN CANADA.



A vise with a grip like grim death; a durability that defies time and the hardest usage.

A vise that will give you a lifetime of perfect service and satis.action. The metal in a Yost Vise is of faultless quality, perfectly distributed and the workmanship is

***Incomparably Good***

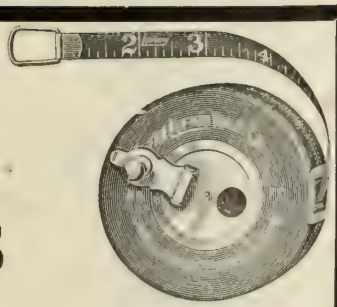
The National catalog would certainly interest you. Write us, asking for a copy.

**National Machinery & Supply Co., Ltd.**

HAMILTON - - ONTARIO

**This Guarantee Goes With Every Vise:** We fully guarantee all of our Vises to be satisfactory in every particular and will promptly replace, without cost, any parts broken or badly worn when such failures are due to faulty material or construction.

# LUFKIN

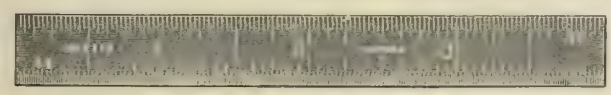


## TAPES AND RULES

## NOTED FOR ACCURACY

We make a complete line of

MACHINISTS' SCALES — MEASURING TAPES
FOLDING STEEL RULES — WOOD RULES
FOLDING BOXWOOD RULES
SPRING JOINT RULES



Our goods are stocked by prominent hardware and supply houses throughout the Dominion. They are fully guaranteed.

# Are Your Operators Doing Unnecessary Work?

Do they begin to lag toward the end of the day because they are tired out, running the milling machine table to and from the cutter by hand? This isn't possible on Brown & Sharpe Heavy Service Milling Machines because they have an automatic fast table traverse. You run the cutter up to the work, pass quickly over spaces between finished surfaces and run back after the cut, all by power. Note the easy method of operation above. The regular table feed is automatically connected when the fast feed is thrown off. A friction in the drive prevents damage to machine or cutters from over-running.

**Send for literature on the other efficiency features.**

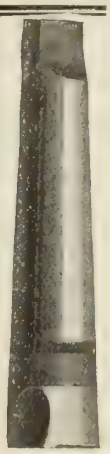
## A Lot of Holes Are Hidden Here

When you look at a freshly stored electric battery you can't see the energy in it but you know it's there. When you look at

# Cleveland Twist Drills



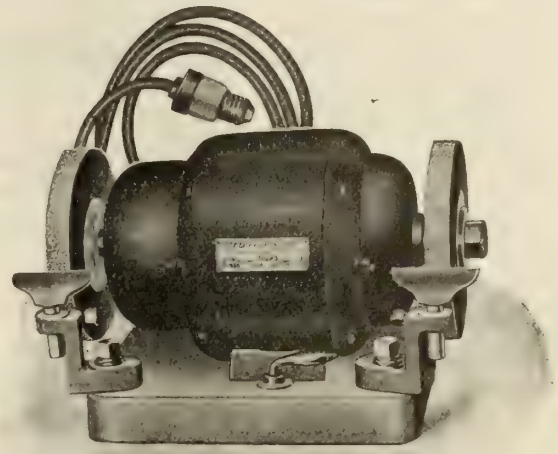
you know that accurate, clean holes through metal are available in the use of them. You can be sure of this because they hold the record. One of them drilled at the rate of 57½" of metal per minute. They are made of scientifically selected and tested materials and with scientific heat treatment.

**Ask us to mail you each month a copy of "Drill Chips."**

**Cleveland Twist Drill Co.**
New York Cleveland Chicago

# ELECTRIC BENCH GRINDER

**You will find it the handiest tool in your Shop!**



**We are now prepared to supply them as follows:**

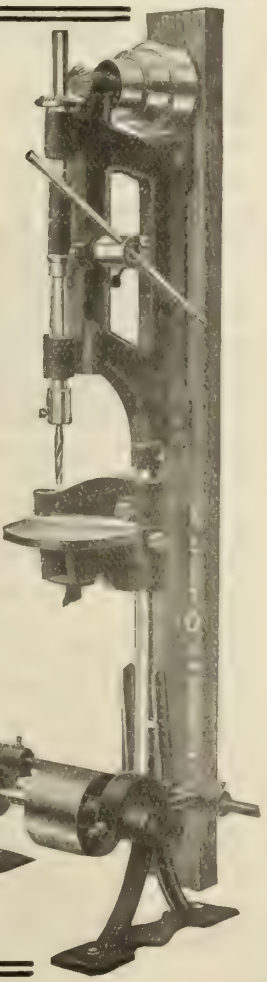
No. 1, 1/6 H.P., A.C., capacity two 6 x ¾ in. Emery Wheels.
No. 2, ¼ H.P., A.C., capacity two 6 x 1 in. Emery Wheels.
No. 2, ¼ H.P., D.C., capacity two 6 x 1 in. Emery Wheels.
No. 3, ½ H.P., D.C. capacity two 8 x 1 in. Emery Wheels.
No. 4. 1 H.P., D.C., capacity two 10 x 1 in. Emery Wheels.

## STOW MFG. CO.
BINGHAMTON, N.Y., U.S.A.

## 16 in. Lever POST DRILL

**A Giant Little Machine For Light Drilling.**

**Will drill up to ⅞ inch.**



**The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.**

**An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle.**

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

Drills to centre of 16 inch. circle.

**Run of feed 5¼ inches.**

Greatest distance between drill spindle and table, 23 inches.

**Spindle bored for ½ inch shank** twist drills.

Speed of countershaft for average **work, 300 per minute.**

**A. B. Jardine & Co.**
**Hespeler, Ontario**

## U. S. Electric Drills and Grinders

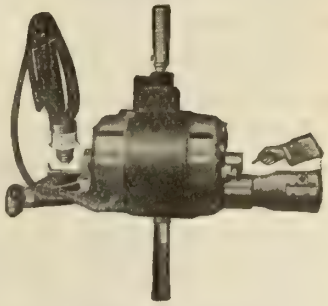
**Save Time, Labor and Money**

They can be attached to any lamp socket.

For drilling in metal they are superior to any other kind of portable drill. Cost 50% less to run than air drills.

**3 SIZES.**
3-16 inch, W.G.T., 6 lbs.
¼ inch, W.G.T. 9 lbs.
⅜ inch, W.G.T. 12 lbs.

All motors wound for 110 or 220 volts. Direct or alternating current.
Try a few of our Electric Drills and Grinders and you'll send us an order for more. Our guarantee protects you.



**½ inch—2 SPEED.**

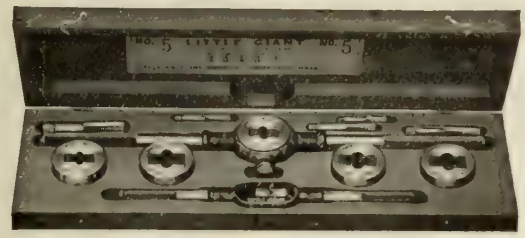
# CONFIDENCE

There is nothing like the satisfaction a workman gets from *knowing* his tools are going to stand up to the work.

This confidence has been enjoyed for 30 odd years by the users of

Little Giant

## Screw Plates



This assurance is stronger to-day because the experience of all these years has developed to their present state of perfection those keen-cutting, perfect-thread producers,

Little Giant TAPS AND Little Giant DIES

See the construction of the die — Better yet, see the tools.

# EFFICIENCY

Manufacturers do not hesitate to discard expensive machinery when the time and labor wasted on such old equipment more than offsets the cost of new machines.

Every file should be considered as a machine. At a certain point in its life on any work it becomes so worn that its efficiency is impaired. It is slow—dull—inaccurate. The extra time it wastes in performing its work would more than pay the cost of several new files.

In the interest of efficiency and economy, it should be replaced with a new file—just as old machines are replaced with new equipment.

This "discard" point in any file varies with the skill of the worker and the character of the work. It is very late in the

**"FAMOUS FIVE"**

**KEARNEY & FOOT**

**AMERICAN**
**ARCADE**
**GLOBE**
***(Made in Canada)***

because they are designed for a long period of maximum service.

They are made by the world's greatest file producers—with an output of 60,000,000 per year. They are manufactured on special machines, of our own design and build. They benefit by all the skill, experience and "know how" gained in our 50 years of "making good." Every step in their manufacture—from steel to finished file—is controlled by us.

Before any of the "Famous Five" leave our works, they must pass tests far more strenuous than any practical work they ever meet.

YOU, too, can cut down your filing-cost by using the "Famous Five"—and replacing them promptly when they have lost their efficiency.

# A Prosperous New Year

A THOUSAND wishes alone would not bring you success in 1915. Although we do sincerely wish you all prosperity in the New Year we are prepared and waiting to back up our wishes with a real and tangible service.

If you are a subscriber, let CANADIAN MACHINERY help you in 1915. If you are a buyer of Machine Tools, consult this directory and the advertising pages.

If you are a manufacturer of Machinery or a Dealer, we can help you to bigger business and a more lasting connection.

Is your name in this directory? If so, there is reasonable expectation that our wishes for your enjoying a prosperous year shall be fulfilled.

# THIS DIRECTORY IS FOR YOUR USE

IF you want the correct 'phone number, you use the official telephone directory.

If you wish to definitely ascertain the location of a certain street, you consult a city directory.

If you are in need of equipment of any description, the best way to buy it is to consult our Buyers' Directory. If what you require isn't advertised in this particular issue, write to the firm or firms listed under the title of the machine you require, and catalog or literature will be gladly sent.

The firms listed in this Directory think enough of your business to ask for it, and they have unlimited confidence in the product they advertise.

Consult this Directory and you can't go wrong.

# No, Stevens' Stopper won't stop a train, but it will stop the blow hole in a defective casting so that you cannot find it.

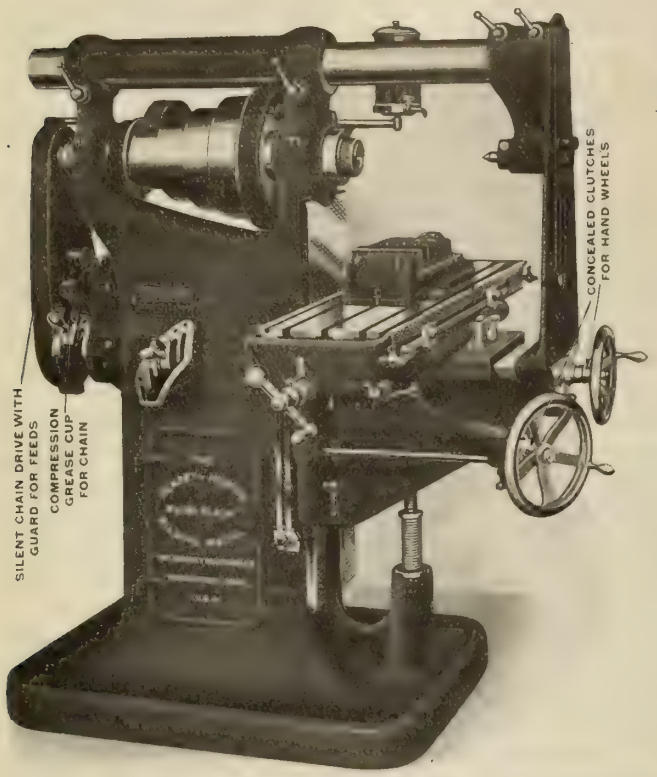
In this way, it helps your bank account. The casting that otherwise would have to go to the scrap heap can be converted into good coin of the realm.
Same color as the rest of the casting. Doesn't look like a blue patch on Casey's faded overalls.
*How to use Stevens' Stopper, or Circle Cement:*
Stevens' Stopper is a fine powder, used with a little water and made into a paste—the hole is easily filled with a putty knife or trowel. It takes anywhere from two to twenty-four hours, depending upon the size of the patch, for the filler to become as hard as the casting itself. When rubbed with a file it shows the color of the casting, hence it is the best filler and the one thing that saves your castings, and that means the saving of your dollars.
Another thing—I do not ask a fancy price for it.
A pound will save many dollars' worth of castings. Put up in 5-lb., 10-lb., and 25-lb. cans.

## FREDERIC B. STEVENS

Manufacturer of
Foundry Facings and Supplies, Buffing Compositions and Platers' Supplies
Corner Larned and Third Sts. DETROIT, MICH.

BRANCHES
Windsor, Ont., 20 Pitt St.
Indianapolis, Ind., 138-140 South Delaware St.

# Hendey Millers will take any kind of a miller job



*that comes in to the modern shop*

**and it delivers the finished work in the highest degree of accuracy and perfection.** It has a wide range of spindle speeds (16) and feeds (18).

The **"Hendey"** is free from the usual complicated features. All working positions are secured with but **few and easily understood movements** on the part of the operator. **Anyone can operate the "Hendey Miller."** No special skill is required to get the service that the Hendey's built for.

**Write for the "Hendey Miller" Book.** It is certain to interest you.

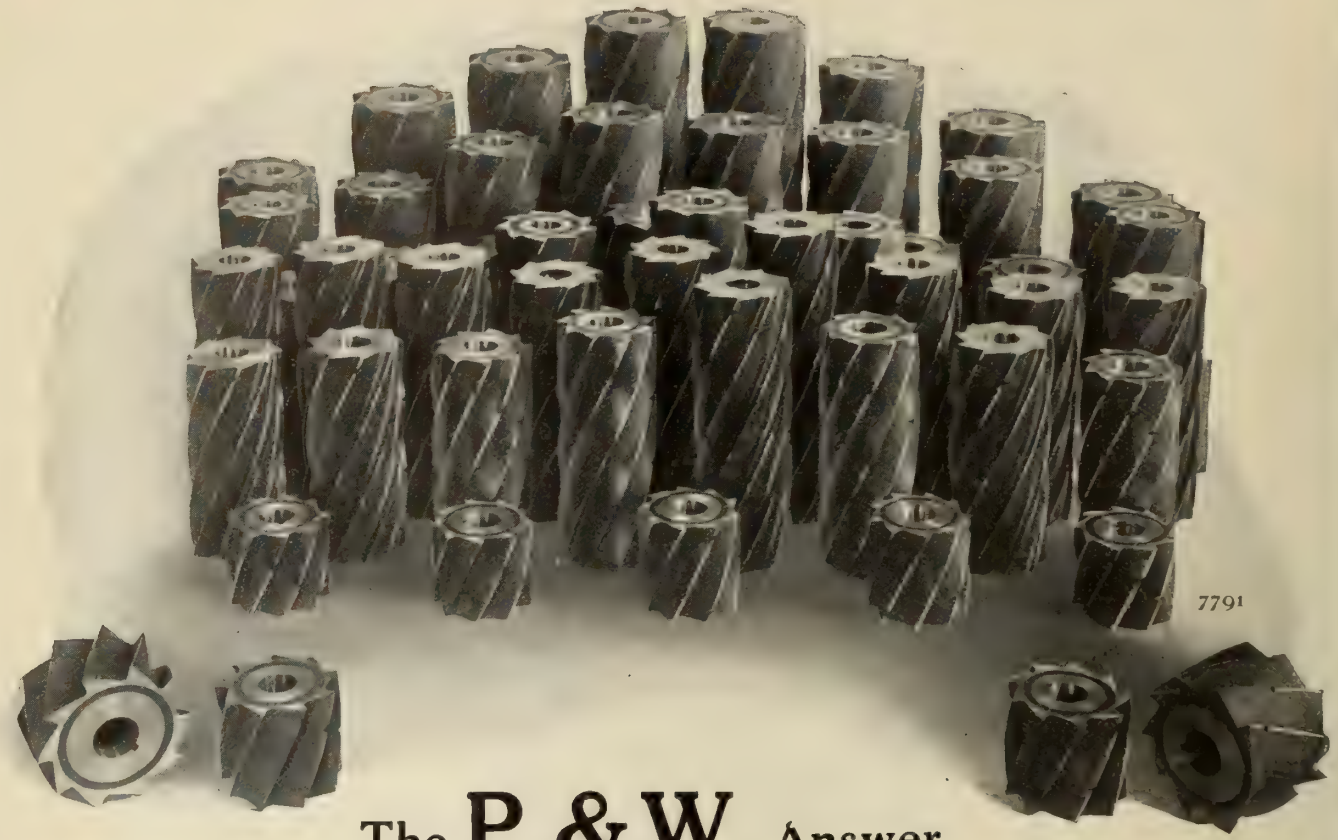
# Your Heavy Duty Cutter Problem



## The P.&W. Answer

### Use Coarse Tooth, High-Speed Milling Cutters

We are prepared to furnish promptly coarse tooth milling cutters of High-Speed Steel adapted primarily to the heavier class of milling.

**Long Life**

Such cutters have the advantage of long life as the large teeth permit of more grindings. It will also be seen that less time is required to sharpen.

**Increased Production**

The ample chip room insures a remarkably free cutting action and will increase production by a high percentage with less power required to drive.

**Strong Teeth**

The teeth being larger are exceptionally strong and will easily stand the heaviest feeds without breaking.

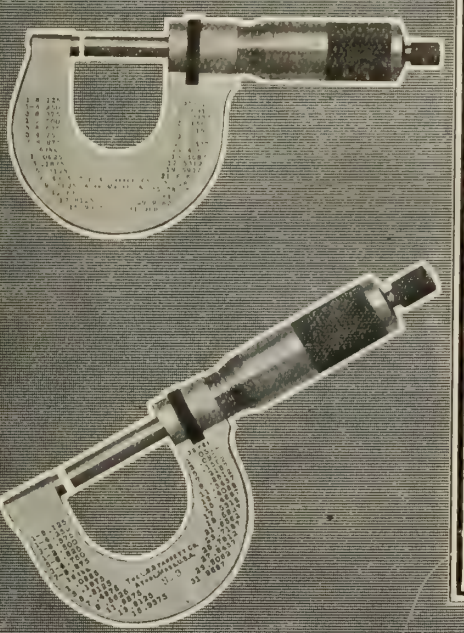
# A Perfect Micrometer for Every Job!

That first essential for a micrometer—accuracy—need only be mentioned when speaking of Starrett micrometers—every mechanic in the country knows that any instrument bearing the name "Starrett" is accurate.

But in addition to their accuracy, Starrett micrometers are made in so many different styles, each adapted to some special kind of measuring, that they have become standard for most good shops.

# Starrett Micrometers



are made in 1" and 2" sizes with ratchet stop and lock nut; also with the quick-acting plunger for rapid measuring. Other styles include thread micrometer for calipering over screw threads, sheet metal micrometer, heavy micrometer for hard use, bench micrometer for inspectors, micrometer depth gages, government micrometer for measurements up to 12", and micrometers in convenient sets.

Wear from long use is taken up by our patented adjustment which permits correction by turning the sleeve until the line coincides with zero on the thimble. This is superior to any other method.

BY INVITATION MEMBER OF

Our 320-page catalog No. 203, giving styles, sizes and prices for all Starrett micrometers, will be sent free on request. **Drop us a card to-day.**

# EFFICIENCY IN BENCH VISES

The man who is responsible for the production of a factory always specifies tools that will give maximum production, irrespective of original first cost. In specifying bench vises, however, this rule is not always adhered to. The usual specification is for a stated number of bench vises of a certain width jaw, irrespective of weight, capacity, or style of construction.

The highest labor cost in any factory is the bench work. It is, therefore, policy to specify vises that have proper capacity, weight and construction.

**Our Catalog No. 22 shows all the good points in vise construction, and will explain why many of the leading industrial shops have used these vises exclusively for over a quarter of a century.**

# Present Your Case

An interesting story is related about Elihu Root, eminent statesman and jurist.

Mr. Root, in his earlier days, was a lawyer of great promise, and won no little fame as an advocate. On the occasion of our story, however, the laugh was on him.

He was engaged upon a case where the evidence was apparently all in favor of his client. It looked like a walk-over as far as he was concerned. He had an abundance of evidence and plenty of witnesses, and as he admitted later, he had no doubt about the issue.

The case came to court, and Mr. Root put his side of it ever so briefly, so sure was he of winning. The opposing lawyer, however, took no chances, and presented the most convincing arguments, and called an imposing array of witnesses. Mr. Root, much to the astonishment of himself and his friends, lost his case.

Questioned about it later, he admitted that it was all his fault. He had an abundance of evidence, more than enough to win, *but he neglected to present it.* He thought the judge and jury would understand how strong his side of the case was without his telling them.

Many a manufacturer makes the same grave error. He himself has the utmost confidence in his product, and because he knows how good it is, fancies the world at large should also know without being told—through advertising.

# Compressed Air and Its Mechanical Production Features*

By E. T. Spidy **

*The service scope of compressed air is, we might say, almost limitless, and its convenience has become so commonplace as to tend to make us neglect to familiarize ourselves with the mechanisms of its production. The author of this paper makes opportunity to get conversant with the latter by clear and easily intelligible featuring of the cardinal points.*

COMPRESSED air is a safe form of power that can be adapted to man's needs where steam or electire power is unsuitable. It is not a new power, its use dates back to the early Christian era from which time it has progressed slowly. Its present-day use in train operation as seen in the form of the modern aid-brake has revolutionized the world, and its use in our shop practices has also caused a small revolution in shop methods. I do not intend to go into and detail of the uses of compressed air, as this would be wasting time, but I have found, however, in my study of the subject, that it is necessary to delve rather deeply into the details of air conditions and changes in order to get an intelligent idea of the whys and wherefores of compressed air. For this reason, after briefly outlining the different types of machines employed to compress air, I will concentrate on the most common type of compressor to explain the effect of the elements as they are encountered. It must be remembered that this is done simply to illustrate the case, these effects having the same relation to smaller or different type machines in proportion to their capacity.

### Compressor Types.

Air compressors may be divided into two general classes, namely, reciprocating machines and rotary machines. Reciprocating compressors may be either horizontal or vertical type, depending chiefly on the available floor space, and this type compress the air through the medium of one or more cylinders containing pistons that reciprocate back and forth discharging air compressed at each stroke. Rotary compressors or blowers discharge a continuous stream of air by means of centrifugal force developed by vanes on the rotor or rotating centre. This type delivers a steady volume up to a few pounds pressure, or else, as in some of the newer types, by other ingenious methods, with oval or irregular shaped casings and special shaped rotors which are designed to trap the air on the inlet side and crowd same out the discharge pipes, giving a positive flow at various pressures and volumes.

It is recognized at the present time that rotary machines are only economical operating at low pressures with large volume output, whereas no limit has been fixed, beyond the strength of the materials in the machines, for pressures attainable by reciprocating type compressors. While in railroad work we are concerned with both types. it is my intention to deal only with high-pressure machines.

### Action of Air Compressors.

Air compressors whether single stage or multiple-stage type, all operate on the same principle. In a single-stage compressor, during the suction stroke air is drawn into the cylinder through valves that may be mechanically operated or they may open by the suction pressure alone. On the return stroke, the inlet valve is closed and the pressure of the enclosed air mounts until it exceeds the pressure behind the spring discharge valves; it is then discharged into the service line leading to the main reservoir. In two-stage compressors this action is repeated by introducing the air discharged from the first cylinder into a second cylinder. This second cylinder is smaller in diameter than the first because of the greater pressures involved, so as to equalize the amount of work done by each cylinder, and to balance the machine in order to keep it running smoothly; the air is discharged from it at the desired line pressure. Multi-stage compressors repeat this process in additional cylinders according to the designed economic output of the machine.

In order to fully understand the construction of air compressors and the trouble of maintaining a regular service, we require first of all to follow the course of the air through a machine in more detail, and to note the changes that take place at every stage. We shall then realize, after a study of these changes, that there is a definite cause for all the phenomena met with. and thereby we shall more clearly see how far the efforts of air compressor builders have been successful in producing the most perfect machine of this type.

For purposes of description we will take a two-stage compressor of modern design and describe in detail the action that takes place. It will be recalled from the foregoing that a two-stage compressor embraces all the features of the multi-stage type compressor and has additions to the single stage type which will be mentioned in due course.

During the past year the author has made a considerable number of tests on different compressors and the figures will be actual results from recent tests on one of the new 2350 cubic foot compressors recently installed at the Canadian Pacific Railway Shops, Winnipeg. Atmospheric air is drawn into the low-pressure cylinder, which is 28 inches in diameter, at the temperature of 65 degrees Fahrenheit, through positively operated inlet valves, and is compressed up to a pressure of 24 pounds per square inch. During compression the temperature of the air rises and upon discharge into the receiver pipe has attained a temperature of 200 degrees Fehrenheit. From this receiver pipe the air passes round a nest of cold pipes called the inter-cooler, its passage being diverted by baffle plates which assure the reduction of the temperature before it enters the second or high-pressure cylinder. The air actually enters the high-pressure cylinder, which is 17 inches in diameter, at a temperature of 80 degrees Fehrenheit. The air is then re-compressed in the high-pressure cylinder to a pressure of 100 pounds per square inch, and during this stage attains a temperature of 225 degrees Fahrenheit, at which temperature the air is discharged into the main reservoirs.

### Isothermal and Adiabatic Compression.

It is to be particularly noted that the temperature of the air rises during compression. We do not need this heat, but it is quite impossible to avoid it. It is the result of the work or energy expended by the machine itself on the air, in changing its volume and raising its pressure. If it were possible to compress air without raising the temperature we should have an ideal condition and would have what is called Iso-thermal compression. Iso-thermal compression or expansion is explained in the first law of gases known as "Boyle's Law" which states that the "Volume of a gas decreases in the same ratio as the pressure on it increases, if the temperature remain constant." Since we know we have the temperature increase to deal with, let us note exactly how it affects the air during compression. The application of heat to any gas causes expansion to take place, and if heat is applied to a quantity of gas in an enclosed cylinder where expansion is restricted, then the result will be that

*From a recent paper before the Western Canada Railway Club.

**Assistant General Foreman, C.P.R. Shops, Winnipeg, Man.

an extra pressure must be generated in the cylinder.

Consider this action in a compressor and it will be seen that the rapidly increasing temperature causes an excess pressure to open the discharge valves a little earlier than they would if the heat were not present. In the intercooler, this heat is removed causing the loss of this excess pressure. In the high-pressure cylinder, the temperature generated again causes the discharge valves to open sooner than required and later when the heat is dissipated in the reservoir and service lines this effect is lost again. Compressing air and not removing any of the heat generated is called Adiabatic compression and this is illustrated in what might be called the second law of gases known as "Law of Charles," which reads: "That the volume of a gas at constant pressure is proportional to its absolute temperature." From this law we see that the temperature increases at a definite rate and that we are able to plot a curve for any particular case which will show us when compared with actual indicator diagrams, how much we accomplish by cooling the air by the means employed.

The necessity of cooling the air during compression becomes apparent if what has been said regarding the effect of temperature in the cylinder has been understood. A single-stage compressor taking in air at atmospheric pressure at a temperature of 60 degrees Fahrenheit and compressing it to 25 pounds gauge pressure has a final temperature of 234 degrees Fahrenheit, and if compressed to 80 pounds gauge pressure the temperature reaches 432 degrees Fahrenheit; and at 100 pounds pressure its temperature is 485 degrees Fahrenheit. A two-stage compressor taking in atmospheric air at the same temperature develops the same number of heat units to reach 100 pounds pressure with this difference, that the final temperature of the air in each cylinder is only about one-half of that of the single-stage compressor cylinder.

### Necessity of Cooling the Air During Compression

It is obvious that in order to lubricate the cylinders to keep them in working condition they must be cooled, and for this reason as well as for the slight cooling imparted to the air in the cylinder, all compressor cylinders are cold water jacketed. This is of more importance in the single-stage compressor cylinder on account of the higher range of temperature per cylinder, because as has been frequently the case, the lubricating oil is deposited as carbon on the piston and cylinder heads and the heat of the compression after vaporizing the oil passes its flash point and thereby causes explosions which are not at all infrequent. Early designers also realized this necessity and sprayed cold water into the cylinder during the compression stroke. Present-day methods make this method impracticable on account of the high speeds of the compressors and the amount of water that would be absorbed by the air during this process.

### Compressing in Two or More Stages.

It has been shown that the effect of the heat generated in the cylinders is to increase the pressure in the cylinders or rather to cause the pressure to reach the discharge point before it would do so if the heat were not present. This excess time of discharge consumes power and it is the main object of compressing in two or more stages to reduce the extra power required to compress the air due to the heat effect. Actual test proves that to compress air in a two-stage machine requires from 12 per cent. to 18 per cent. less power than to obtain the same results in a single-stage machine. Multi-stage compressors show a greater saving, still dependent, of course, on the design.

### Reheating the Air.

If it were possible to use the air immediately it left the machine, that is, before the heat of compression is lost in the pipe lines by radiation, etc., we should not require to bother with this troublesome element beyond the compressor itself, because its expansive effort could then be utilized in the motor or other engine driven. We should in that case by cooling the air be losing power. This advantage is made use of in small outfits, but with plants that have a network of reservoirs and pipes in which to maintain a pressure, it is impracticable because the reduction in temperature is bound to take place somewhere or other, and this reduction causes the moisture in the air to be precipitated. This moisture deposited shows itself in the form of water in a way we are all familiar with. The losses due to temperature, friction, etc., on long lines is considerable and the use of reheaters is extremely economical under special circumstances. Reheaters are used somewhat extensively in connection with the Popp system in Paris. This system supplies compressed air on an industrial basis similar to the way electric power is supplied here.

Professor Unwin says that 46 per cent. more energy may be obtained from the air by the use of a reheater, by the expenditure of a small quantity of fuel in a suitable heater. Air delivered to the reheater from a source perhaps several miles away at a temperature of 59 degrees Fahrenheit is, after passing through the reheater, delivered to the machine at a temperature of 299 degrees Fahrenheit, which temperature closely approaches the useful limit of reheating air. These heaters consist either of a coil through which the air passes, the coil being placed in a coke or oil furnace, or else of a cast iron oven heated by a coke fire underneath along the lines of a hot air household furnace. It has been calculated that fuel spent reheating air in this manner turns six times the number of heat units into useful work that the best steam boilers and engines can obtain.

The temperature of the air as it enters the compressor plays two very important parts in practice. The first of these is that air always contains a certain percentage of moisture, and while the amount of moisture carried by the air does not affect the compressor itself, it sure does effect its successful use in our shop practices. Air readily absorbs moisture and the higher its temperature the more moisture it can contain. This is what we commonly call humidity. The percentage of humidity merely means the percentage of moisture the air does contain compared with the amount it can contain at any temperature. For this reason intake pipes should always draw air from the outside of the power building rather than from the inside, because the presence of free steam near the intake of the compressor greatly increases the amount of water to be deposited somewhere in the service.

### Water in the Air.

The greater the air pressure the less moisture the air can hold in suspension. In practice this fact can be neglected because the amount of deposited moisture due to pressure is so slight compared with the temperature effect which increases the power of suspension at a very much greater rate. Moisture or water cannot be entirely eliminated from service lines, but much of it may be deposited by proper cooling devices. Moisture enters the compressor in the free air and passes into the inter-cooler where some of it is deposited by the sudden temperature drop there. In some machines this deposited water is drained off, but in others it passes with the air into the H. P. cylinder, and the heat of compression readily absorbs the same again, passing it most often direct to the reservoirs. If an after-cooler (this is a nest of cold tubes of exactly similar construction to the intercooler) be placed between the discharge pipe of the H. P. cylinder and the reservoir or service lines, the temperature of the air will be suddenly reduced to normal and most of the water will be deposited where it can be drained off easily. The idea is to ensure the reduction of the temperature

of the discharge air to normal before entering same into service pipes.

Another way is to connect at least three reservoirs in chain so that the air has to pass through all of them separately before entering the lines. This will collect the water very well, it being necessary to drain the reservoirs very frequently. By reason of the same law that the air heats upon compression. so upon expansion of the air, such as takes place at the point of operation, does the temperature drop in the same ratio. This accounts for the way our motors sometimes clog up with ice in cold weather when any amount of water is present. This principle is used to good advantage in certain classes of refrigeration machinery. Liquid air is also made by this process. The only way to avoid this trouble is to remove the water or warm up the machine.

### Effect of Intake Temperature on Discharged Volume.

Apart from the moisture-carrying capacity of the air, the temperature of the intake air has a second and very important effect. and this is upon the volume of air discharged by the compressor. As we know already, heated air takes up more space than cooler air. It can be understood, then, that a cylinder full of heated air means a less amount of air than a cylinder full of cooler air, because it is thinned out. so to speak. In round figures, the gain in efficiency or the increase in actual output amounts to 1 per cent. for every 5 degrees lower the temperature of the intake air is than the temperature inside the power building. This is another very good reason for having the intake air drawn from the outside atmosphere.

### Effect of Altitude.

Atmospheric pressure at sea level we know is 14.7 pounds per square inch. This pressure is caused by the weight of the air above, and for every 1000 feet ascent above the sea level there is approximately a decrease in atmospheric pressure of one-half pound per square inch. Conversely also in deep mines the pressure increases at the same ratio. Thus, in considering compressed air requirements, altitude of the location must be considered if the machine is to be placed at any sensible height above the sea level, such as for mountain service.

To illustrate the effect, let us take the two-stage compressor described and transplant it at a point 3,000 feet above the sea level. We should find that the density of the air at this altitude was only 90 per cent. of the density at sea level. This is to say that at the same working speed we should have suffered loss of 10 per cent. in volume delivered. To correct this we require to supply more power to raise the speed the necessary 10 per cent. in order to raise the capacity to what it should be. The air being thinner or less dense, the power required to compress one cubic foot of it is less than at sea level. Actually we should require 4.3 per cent. extra power in order to get the 10 per cent. extra speed.

### Compressor Explosions.

Air compressor explosions are a comparatively rare occurrence but yet of such importance that the causes of explosions will stand to be better understood. To have an explosion we must have an explosixe mixture and a means of exploding the same. It is not difficult to find the source of the combustible, it being the lubricating oil in most cases, but it is more difficult to understand how it becomes ignited. Explosions are most always the result of oversight or neglect, which fault compressor builders cannot do a great deal to lessen the chances of happening by proper design. We can understand how the deposits of carbon reach the valves and passages especially if a grade of oil is used that has a flash point below 600 degrees Fehrenheit, but as often as not the explosions have taken place where lubricants have a flash point over 700 degrees Fahrenheit have been used. It is obvious that excess temperature must be developed and the following causes have all contributed to their share of damage:

If supply of cooling water for cylinder jackets and intercooler become shut off, the compressor will heat up very quickly, and when this happens the machine must be shut down immediately. With the cylinders becoming hot, the air during admission will be preheated and the final temperature in the cylinders is then much greater than it would otherwise be.

It is seen, then, that a heat building process is started which has no limit beyond the temperatures the materials of construction will withstand. It has happened with the carbon and oil deposit in a compressor with a rather small discharge pipe area, that the pipe area becomes so restricted with these deposits that the friction of the air increased the temperature beyond the flash point of the oil thus causing an explosion. This occurs because greater pressure is needed to force the oil through the passages and the extra temperature accompanies the extra pressure in direct ratio.

The greater source of danger is in discharge valves becoming coated with carbon deposit and becoming stuck in an open position. This allows hot compressed air to get back during the suction stroke due to the pressure already in the cylinder, the temperature rises away above normal and ignites any mixture that may be at hand.

Air compressors with inlet throttling devices to reduce the amount of discharged air when the full capacity of the machine is not being used need particular care to avoid carbon deposits because of the high temperature ratio developed when throttled down less than half capacity. This more particularly applies to constant speed compressors wherein speed regulation in connection with output is impracticable.

Failure to keep the intercooler free from scale or mud deposits on the water side of the pipes interferes seriously with the cooling efficiency of the intercooler, with the result that the air enters the high pressure cylinder at a higher initial temperature than it should. This not only impairs the volumetric efficiency of the compressor but also helps to form an explosive mixture.

Many explosions have occurred in air reservoirs also. Most often the cause has been traced and found to be that the reservoir at some time or other held

### PUBLIC RIGHT.

**The idea of public right when translated into concrete terms means first and foremost the clearing of the ground by the definite repudiation of militarism as the governing factor in the relation of States. It means next that room must be found and kept for the independent existence and the free development of the smaller nationalities each with a corporate consciousness of its own. They must be recognized as having exactly as good a title as their more powerful neighbors—more powerful in strength and in wealth—to a place in the sun. It means finally, or it ought to mean, perhaps by a slow and gradual process, the substitution for force, for the clash of competing ambition, for groupings and alliances and a precarious equipoise of a real national partnership based on the recognition of equal right, and established and enforced by a common will. A year ago that would have sounded like a Utopian idea. It is probably one that may not, or will not, be realized either to-day or to-morrow, but if and when this war is decided in favor of the Allies, it will at once come within the range and before long within the grasp of the world's statesmen.—H H. Asquith.**

oil. Under such circumstances, as shown, an explosive mixture has been made with disastrous results.

### Compressor Efficiency

Owing to the somewhat complex nature of the happenings in an air compressor, the total measure of efficiency of any machine can only be determined by finding the measure of efficiency from three separate standpoints. These are Volumetric efficiency, Mechanical efficiency and Thermal efficiency.

The volumetric efficiency of a compressor is the ratio of the actual amount of air at atmospheric pressure and temperature, delivered compressed into the main reservoir, to the cylinder displacement. Cylinder displacement meaning the total space swept by the piston or pistons of single-stage compressors and only the low-pressure cylinder displacement in two or multi-stage compressors.

The mechanical or compression efficiency of a compressor is the measure of the energy in horse-power put into the machine for which a certain delivered amount of compressed air is obtained, compared with the theoretical horse-power required to compress that same quantity of air, when heat of compression is removed as quickly as it is generated.

The thermal-efficiency of a compressor is the ratio of temperature of the delivered air to the temperature of the intake air.

Briefly summarized the following are the causes of loss in compressor efficiency, and the remedy where possible:

1.—The clearance space between the piston and cylinder ends is a source of loss of volumetric efficiency, and for mechanical reasons it is not possible to do away with this clearance space. It is seen that this space must be filled at each stroke with atmospheric air which is compressed to discharge pressure at every stroke. This amount of air is never delivered, and is, in consequence, a loss in volume delivered, although not so much a mechanical loss by reason that this air gives back to the piston its stored energy because of its expansive power.

2.—Heating of intake air is a volumetric loss on account of the expansion due to heat absorbed, as explained earlier in this paper. We require to be careful that the passages of the intake air from the outside atmosphere to the suction valves are insulated from any heat such as from steam pipes or other hot surfaces under or over the power house floor.

3.—Wire-drawing, or in other words, friction of the air in intake passages, due to small passage area, is a volumetric loss because the cylinder will not be completely filled with air on the suction strokes. If we do not completely fill the cylinders with free air it is obvious we cannot compress it.

4.—Leakage of air through valves or past the piston is a large source of volumetric loss by reason that any air that leaks past is in a heated condition due to the effect of previous compression. Not only is this a loss from the side it has left, but it causes a loss where it arrives by increasing the temperature ratio giving the effect of heated intake air.

5.—Pressure required to overcome the resistance of air in discharge passages is a mechanical loss because no increase in amount of air delivered is done by this work. Passages require to be kept free from deposits to facilitate the moving of the air otherwise friction will become excessive.

6.—Heat of compression causes both mechanical and thermal loss by reason that the temperature develops excessive pressure in the cylinders which is afterwards lost upon the cooling of the air. Good water jacketing of cylinder and heads and clean intercoolers insure the best results in this connection.

7.—Upkeep of compressor mechanism is important because inaccuracy of action of valves, etc., causes not only mechanical loss but volumetric and thermal losses as well.

### Indicator Diagrams.

The question that most probably arises at this point is: How are we going to watch all these points since there is so much detail to be taken care of? I would answer, "Indicate your air compressors regularly." The value of indicator diagrams on steam cylinders is well recognized, and as air compressor cylinders are practically identical with steam cylinders with only valve modifications, the value of diagrams from air cylinders is unquestionable. Diagrams from two-stage and multi-stage compressors require to be compounded to show relative value of heat and energy expended in each cylinder. By placing theoretical compression curves with and without heat effect on a diagram it can be seen at a glance where the losses are to be found. The engineer in charge may notice many defects but there are as many he cannot see because they do not affect the gauges on the machines.

Regularly-taken diagrams save the repair bill or shut-down by reason of the advance information given which enables preparation to be made for coming trouble. The advantage is thus two-fold because not only is the defect and cause ascertained quickly from the diagram, but also power computations are as easily made. When once this system of inspection is started and understood, I am fully convinced it would not be dropped because the results will far more than justify the trouble of obtaining this information.

## CANADA LEADING IN WATER POWER DEVELOPMENT.

THAT Canada is at present utilizing more electric power per capita than any country in the world was the remarkable fact brought out a recent meeting of the Canadian Society of Civil Engineers at Montreal. It was shown that not only is infinitely more power per head developed here than in any European country, but that we lead the United States three times over in this development. The electrical power developed in Canada amounts to one horse-power per year for each eight people, as against one per 24 in the United States, and one per 100 for Europe generally. It was, however, pointed out that this was apt to be misleading, as Europe included such countries as Turkey, Russia and the Balkan States, where electrical development was practically unknown.

The foregoing information was elicited from a paper read by A. Surveyer on "How to Make Water Power More Valuable." In his paper, Mr. Surveyer pointed out that there were known to be in Canada no less than 17,764,000 electrical horse-power available by water powers, and of this enormous amount only 8.2 per cent was as yet utilized.

This, he said, meant that there was in the Dominion an immense field of potential wealth awaiting development. So far, the chief way in which the Canadian water powers had been developed was in the production of electricity for light and power, but with the immense power now running to waste there was untold opportunity for the development of electro-chemical and electro-metallurgical industries. It was undoubted, he said, that many water powers could be profitably harnessed in connection with these industries. He instanced the production of calcium carbide, which was in great demand; the electric production of nitrate of lime for fertilizers, as was successfully being done in Norway; the production of nitric acid, calcium, cyanamide, and the electrical production of aluminum, zinc, nickel and copper, as well as high-class steel for tools.

### More Publicity Needed.

Mr. Surveyer argued that the lack of development was partly due to lack of knowledge regarding the possibilities of profitable development of these water powers. To overcome this, he suggested that the various Governments, Dominion and Provincial, should undertake a systematic series of surveys of water powers, and publish the results, so as to make them available for manufacturers and investors.

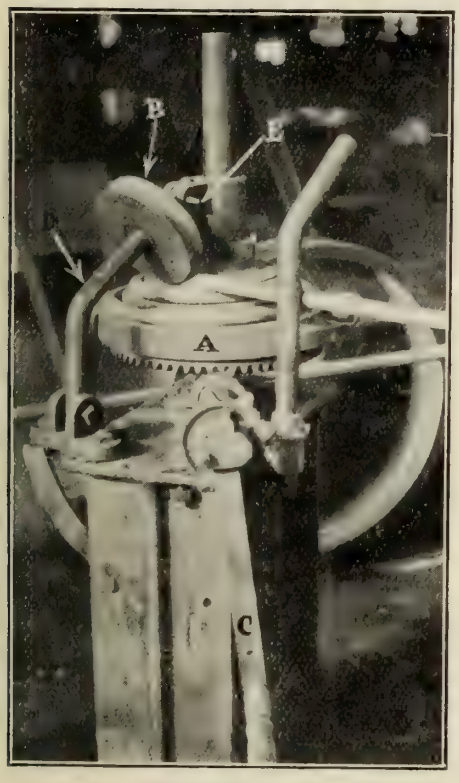
# PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

## A NOVEL PIPE BENDER

By E. Avery.

A DEVICE for beinding heavy copper pipe into a coil, for use in a condensing apparatus is here shown. The pipe is three-quarter inch, and is heavy enough to bend without the need of filling of any kind. One end of the pipe is threaded and has an elbow screwed on. This is placed back of a pin set into the lower end of the "thread" of the master-form A. The grooved roller B is then set against the pipe, and the form is revolved by turning the handle C. As the pipe is gradually bent round the "thread" of the form, the roller travels up the bar D accordingly, and when the coil is completed, the pin E is pulled out and the bar and roller thrown back, leaving the coil free to be lifted off.

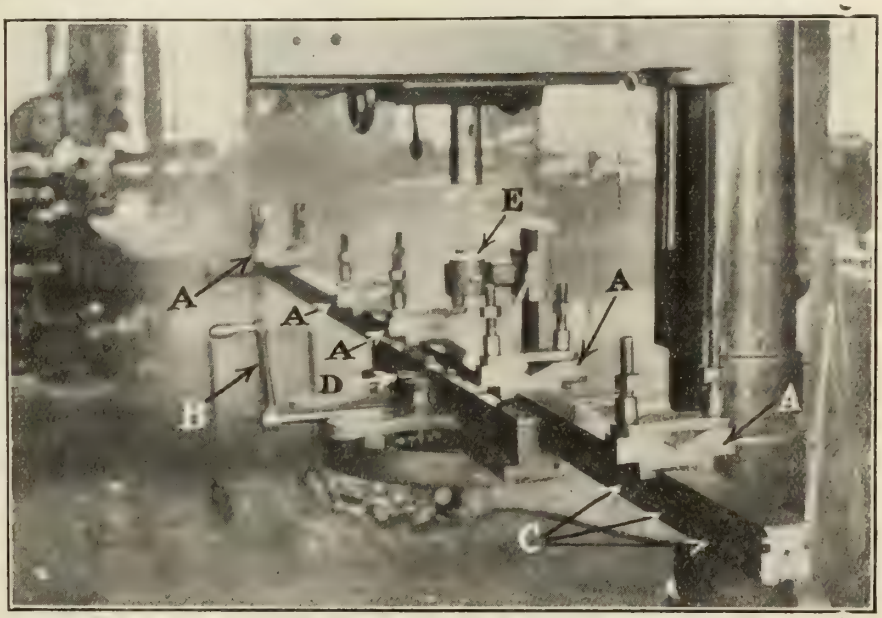


A NOVEL PIPE BENDER.

## IRREGULAR SPACING FOR REAMERS.

By D. S. Mann.

FOR reamers and boring heads of the long-blade type, it is desirable to have the blades unevenly spaced in order to break up the cutting and thus prevent chattering. It is also desirable to have the blades on the two sides of the body exactly opposite in order to easily determine the diameter. The table gives the number of turns for the dividing head for from 4 to 24 blades (or flutes). The movements are but for one-half the reamer and should be repeated for the other half.



A PIPE DRILLING FIXTURE.

## A PIPE DRILLING FIXTURE.

By A. E. Granville.

THE accompanying photograph illustrates a fixture used for drilling evenly spaced holes in header pipes. This device was made by the Artic Ice Machinery Co., Canton, Ohio, for use in their own shops. The pipe to be drilled is laid in the V-blocks A and clamped down with the straps shown. The carriage or slide to which the V-blocks are bolted, has a rack running along the bottom, into which a pinion operated by handle B meshes, so that the operator can easily run the pipe along as needed, in either direction. Holes are drilled one inch apart along the side of the slide, as shown at C, and a pin D is used to insert in these holes and lock the slide as it is moved the required space. An adjustable bracket E carries a drill

bushing to guide the drill into the pipe. This bracket and bushing may be removed altogether when tapping out the drilled holes. Holes drilled and tapped in this fixture will all be correctly spaced and pipes screwed into them will be parallel.

## THE DYNAMIC BALANCE OF PULLEYS.

By C. Causey Smith.

IN a Western manufacturing plant whose product consists very largely of lumber mill machinery, there occurred a costly little incident that resulted in the development of a simple way out which has proved useful upon many subsequent occasions. An engine belt had been

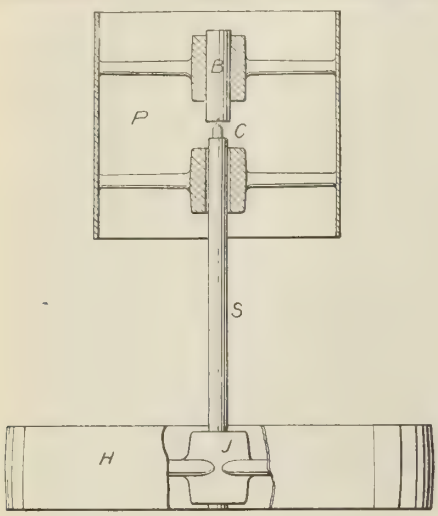

FIG. 1. TEMPORARY METHOD OF TESTING PULLEY FOR RUNNING BALANCE.

equipped with a tightening device which consisted of a wooden frame and an idler pully. The framework was securely bolted together and swung on a shaft at its upper end so that the other end which carried the pulley was free to move up and down as the tension of the belt demanded.

The pulley was twenty-four inches in diameter, had a face of thirty inches and ran at a speed of 620 r.p.m. Upon the engine being started up for a trial run, the engineer complained that the idler pulley was very much out of balance. Upon examination his claims seemed to be well substantiated. The pulley being some eight feet from the hinged end of the frame which was its only point of support seemed likely to shake down the whole affair. It was immediately ordered back to the shop with some curt directions that it be balanced.

The man who had balanced it was somewhat mortified to see his job given to another mechanic to check up. This man, however, on placing it upon the rails found it very nearly correct. Being doubtful, he smoothed and leveled his bars and tried it again only to find that his predecessor's work was substantially right. The job being wanted in a hurry, little more thought was given the matter and the pulley again sent to its destinationly only to cause the same trouble as before and considerably more ill-feeling on the part of the engineer.

The matter was called to the attention of the superintendent, who, upon arriving at the mill and hearing and seeing the actions of the tightener was not long in ascertaining the cause of the trouble. The troublesome pulley was again brought to the shop and, upon examination, was found to be originally out as shown at B, Fig 3. The man who had attempted to correct this had done so by placing the balance weight of 2⅝ pounds at the other end and on the opposite side as shown at C which, according to his ideas of static balance should accomplish the desired end.

A little consideration of the figure, however, will show that, while the balance weight thus placed effectively balanced the pulley while at rest, its running or dynamic unbalance was very much increased. The centrifugal force of the two unbalanced weights tended to form a couple about the centre of the pulley and produced a wobbling force which, at the full speed of the engine, became enormous. The correct position of the balance weight is, of course, at A directly opposite the centre of gravity of the unbalanced weight of the pulley.

### A Temporary Device.

The method adopted for correcting the running balance is shown in Fig. 1. A spindle S was made up of a piece of 1 7-16-inch cold rolled shafting by drilling a hole in the end to fit a hardened centre C which belonged to a tapping outfit of one of the radial drilling machines. A pulley H was procured for a support or base plate and the upright spindle was fastened into the hub J by driving a couple of half bushings belonging to a wood split pulley between it and the spindle. A short piece of 2 3-16-inch cold rolled was now centred and driven lightly into the hub of the pulley to be balanced so that the centre in the end of the plug B would be just slightly above the centre of gravity of the pulley P as shown.

A line was drawn square across the face of the pulley at the centre of the balance weight location as had been determined by static balance. The weight was now removed and a ball of clay made up of exactly the same weight. All that was now necessary was to hang the pulley upon the point as shown and spin it around by hand marking the wobble as when truing up a piece in a lathe. After a number of trials and moving the clay along the line each time the point was found where it would balance the pulley perfectly at any speed. This position on the line was marked and the balance weight carefully fastened at this point. The pulley upon being again set up was found to balance perfectly.

### A Simple and Efficient Machine.

As a considerable amount of this work was to be done, the machine shown in Fig. 2 was designed and built to do it expeditiously and to do away with the labor of spinning and stopping heavy pulleys by hand. The base or frame A is in the form of a heavy angle plate with one side resting on the floor. The vertical spindle E is supported in a pivot bearing T and a solid babbited bearing further up. It is driven by means of a belt through a beveled paper friction whose friction pressure can be regulated by the set-screw and lock-nut as shown.

The sleeve L slides up and down on the vertical spindle by means of the lever H and, as it is fitted with a feather key at its lower end which fits into a corresponding keyway in the spindle, it revolves with the vertical shaft. This sleeve and lever are counterweighted by means of the weight W. The sliding part B is also in the form of an angle plate with the hori-

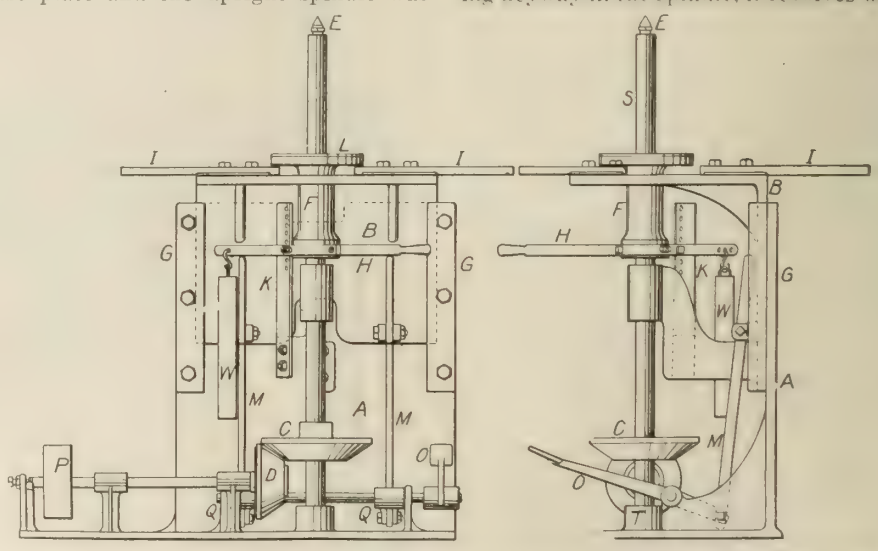

FIG. 2. MACHINE DESIGNED TO DETERMINE RUNNING BALANCE OF PULLEYS.

zontal side uppermost and the back sliding in the guide G. This is raised by the foot-pedal O through the horizontal shaft and the two lever arms Q and the links M.

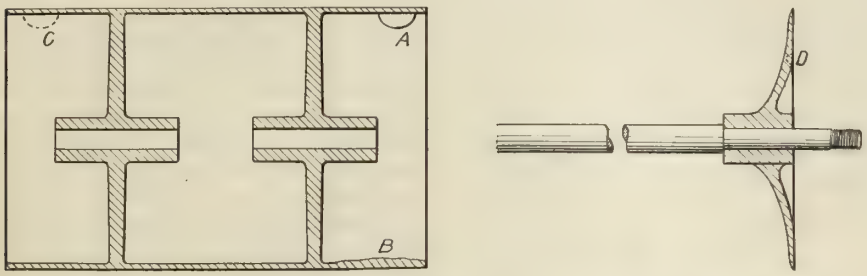

FIG. 3. EFFECT OF STATIC BALANCE ON PULLEY AND SAW ARBOR.

The top face of this angle plate is chambered out so as to clear the flange of the sleeve and is provided with grooves for holding the three wooden arms I which are bolted to it. These arms project radially 120 degrees apart and are of such length as to support the pulley to be balanced by the rim.

The method of procedure is as follows. The pulley is first statically balanced, as it has been found the quickest way to determine the amount of unbalance and the radial location of the balance weight. Substituting the centre plug for the arbor as before described, the pulley is hung upon the point C so that its centre of gravity is barely supported. The machine is now started up and the sleeve L is raised until the top of the flange which is leather-faced, presses sufficiently against the hub of the pulley to give it the desired speed. When the chalking is done, the pulley is quickly brought to rest by the foot treadle which raises the three radial wood arms against its rim with any desired pressure. Some little trouble is experienced upon starting if the pulley is badly out of running balance, but enough speed to indicate the unbalance is easily attained in any case. For different sizes of pulleys the lever H can be adjusted up and down the post K and, in the same way, the links M can be shortened or lengthened at their connections to the angle plate. The outfit is completed by suspending an air drill by a counterweight so that the drilling and countersinking can be done on the spot and without requisitioning a large drill press.

**Dynamic and Standing Balance.**

It is evident that dynamic balance becomes more important as the width of the pulley face increases. In the case of the saw arbor in Fig. 3 the drilling of holes such as is done at D serves to balance the disc both statically and dynamically while in the pulley if the weight be wrongly placed as at C, Fig. 3, the effect is to aggravate the original trouble. There are ways of statically balancing pulleys and discs, which give even more accurate results than the balancing rails. These have mostly been developed by the necessities of the steam turbine, centrifugal pumps, blowers, etc. The disc may be freely suspended by a pair of cone centres from a point slightly above the centre of gravity and simply leveled up by balance weights. The dynamic balance is secured by attaching this outfit to the spindle of a drilling machine and rotating it at a speed sufficient to indicate its running unbalance. Very much can be added to the quality of ordinary narrow-faced pulleys which are balanced statically if the mechanic will take the trouble to determine by examination the approximate location of the unbalanced weight and so place the balancing weight as to neutralize its centrifugal force as well as its dead weight.

## DRILLING AND GRINDING FIXTURE.

D. O. Barrett.

THE drawing, Fig. 1, shows a part used on a gasoline engine for supporting the lever operating the exhaust valve. This is held in place by two of the head studs and is disk ground on the two pads which set against the stud bosses. The boss on the post carrying the lever is finished by spot facing.

The first operation is that of disk grinding the two pads, and this is done by the fixture in Fig. 2. These were formerly held merely by hand, but, as the casting was not very broad, more would be ground off the one side than the other and the levers would not then line up properly with the valve stems; a great amount of filing being afterwards necessary. The fixture is bolted on the sliding table of the disk grinder, and the piece is placed between the two V-jaws, one of which is slidably mounted, and may be pulled back by the pin projecting from the end. This jaw is pushed up by a flat spring. The fixed V at the back locates the boss on the post correctly and, having placed a casting in the jaws in somewhere near the proper position, it is held there by the spring jaw until further pressure is brought to bear upon it. When the casting is now brought up against the grinder disk lightly, it is pushed back into the fixed V and the two pads will be lined up evenly when the sliding jaw is locked by means of the lever nut. Any further grinding causes the casting to heat which will aid in clamping it still tighter.

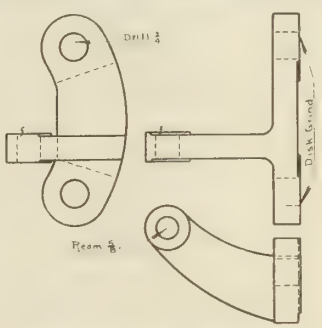

FIG. 1. SUPPORT FOR LEVER OPERATING EXHAUST VALVE.

The drill jig is of box form with one open side. The casting is held between two jaws of exactly the same shape as in the grinding fixture so that it will be located in exactly the same relative position. In this case, however, the movable jaw is pushed away from the casting. Instead of towards it by two springs

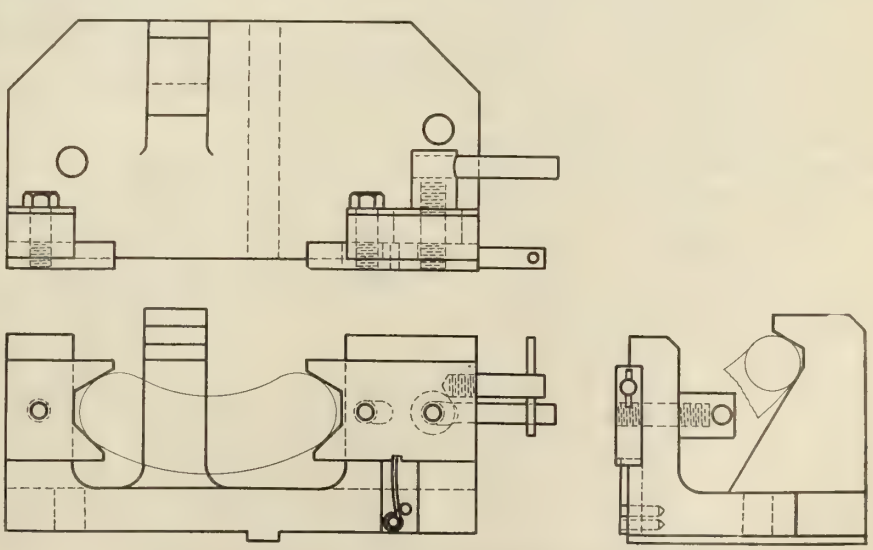

FIG. 2. FIXTURE FOR DISC GRINDING LEVER SUPPORT.

which are of helical form and located in two drilled holes closed with plugs, these springs pushing against the studs by which the jaw is held in place. This jaw is pushed up against the casting by a T-head screw projecting from the one end.

Two wedges are driven in across the feet of the casting after it is centered between the jaws, while a third is merely

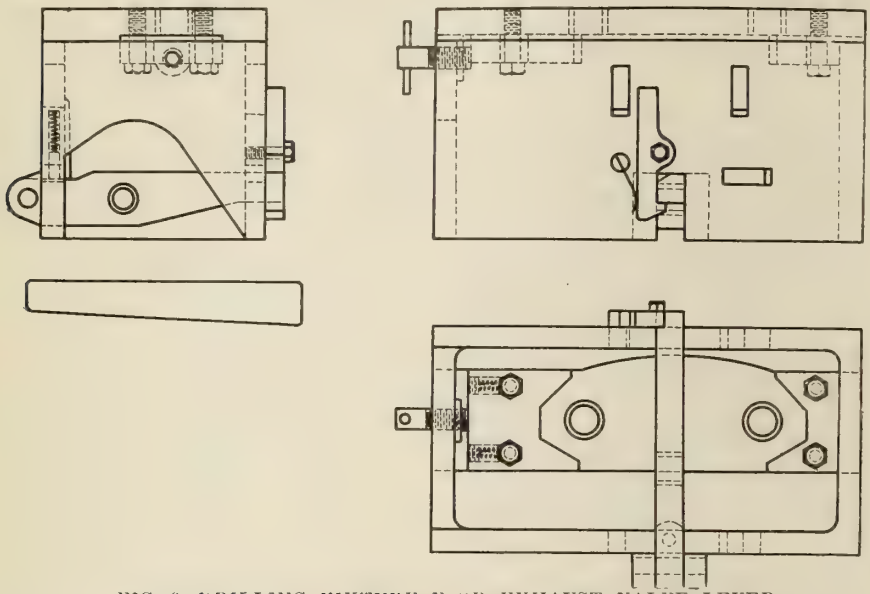

FIG. 3. DRILLING FIXTURE FOR EXHAUST VALVE LEVER.

pushed in by hand to take the thrust of the drill and facer when operating on the post. The drill bushing for the hole in the post is carried in the steel cross arm which is hinged at the one side. The other side is provided with a snap clasp so that the bar is merely pushed down into the slot and locked there automatically. The drilling is done with the jig on end, and after drilling the hole in the post, it is necessary to swing back the bar for reaming and facing. In order to make it possible to unlatch and remove the bar with the one hand, a small plunger provided with a rather stiff spring is placed under the bar near the hinge; as soon as the bar is unlatched this spring immediately pushes out the bar. Having to reach down into the jig so far necessitates having the box somewhat larger than would be necessary were it possible to drill and ream the hole from the other side, omitting the bushings in the leaf to the different thicknesses of the work to be drilled. The drill bushings of a slight driving fit, are made of the best grade of tool steel hardened and lapped, and ground inside and outside. When grinding the inside of a long bushing the upper part should be relieved, either by tapering out or by increasing the diameter of the hole about .010 inch as shown at B, and to a depth about twice the diameter of the drill employed, from the bottom end of the bushing. Some designers are inclined to locate the bushings so that the thin lower end will stop about the same distance above the work as the diameter of the drill, in order that the chips clear the bushing readily. The writer has found it most practical to locate the bushing very close to the work—about .005 inch from the working surface.

If the drill is properly sharpened, all the chips will slide freely through the spiral groove of the drill while in the bushing. On the other hand, if the bushing be placed above the work, all the chips will clog in between it and the work, and the result is, that when withdrawing the drill, the chips will cling to the spiral groove of the drill, and come out between the bushing and the work. This is often the cause of a drill being bent and broken. Then, too, if a hole be half drilled, it is not practical to get all the chips out between the bushing and the work. When starting to drill again, the point of the drill always catches the flat chips and drags them down into the centre of the hole, thus forming a shoe on the point of the drill, which prevents it from cutting. Another feature found very practical is not to round the corner of the bushing in the bottom end, but to have it sharp or square. In so doing, the chips will not cling in between, but follow the spiral groove of the drill.

It is not as a general rule good practice to place a handle on a drill jig, but this particular case is an exception. When relieving the work from the jig, the top screw is manipulated the same as a handle. First, unloosen all the knurled finger screws from the work in the jig by pressing the right hand thumb on the cam, thereby releasing the lever. With the left hand on the top screw, swing open the leaf. As the handle is low, the jig cannot tip over. Some designers place the head of the bushing on the inside of the leaf to serve as a support for the work to be drilled. This is very good practice in cases where one or more holes are at right angles with the leaf, as it makes a small bearing surface to keep clean, and it means that the drill must start accurately.

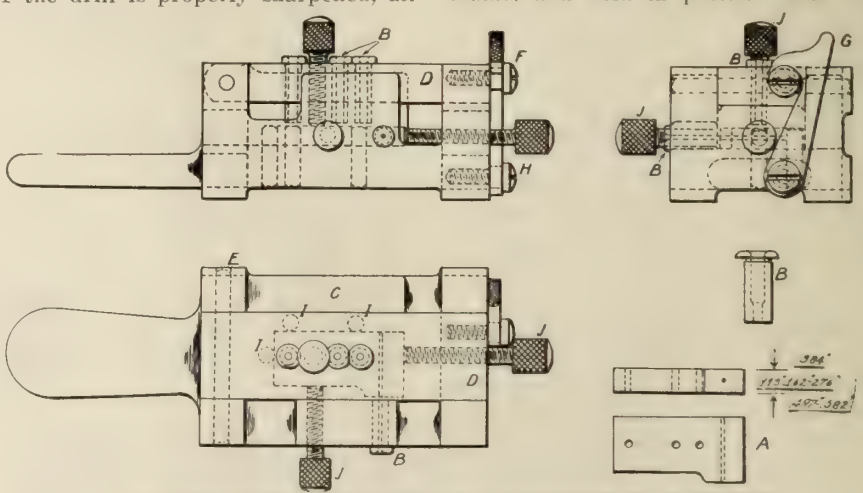
The jig frame C, is made of hard fine grain cast iron and finished all over to dimensions. A low grade tool steel leaf D is fitted snugly in the centre of the frame, and held in position with a ¼ inch straight pin E. These holes should be drilled, bored and reamed on a face plate in an engine lathe in order to get them perfectly square with the leaf and

(Continued on page 52.)

## SOME POINTS IN JIG DESIGN.

By. A. L. Monrad.

THE drill jig shown herewith is cheap and simple, yet very effective in the production of interchangeable parts. There are six different thicknesses of the model A shown. The location and shape are alike, the same jig being used by simply changing the different lengths of



JIG FOR DRILLING PIECES OF DIFFERENT THICKNESSES.

## PROBLEMS RELATING TO SCREW THREADS.

A SCREW thread in its simplest form is a continuous wedge or inclined plane. If the length of the wedge be considered equal to the circumference of the screw, its height will be equal to the pitch. This can be easily proved by cutting a piece of paper to the proper wedge shape and wrapping it around the screw or rod. The angle of the inclined plane depends upon both the pitch and the diameter of the screw. In calculating the power transmitted by screws, it must be borne in mind that the friction is a variable and an unknown quantity. An average value might be taken as 50 per cent., but it increases very rapidly, and is much greater than this at higher loads.

* * *

**Question.**—A planer raising screw is driven by a belt through a 14-inch pulley and a gear and pinion of 96 and 12 teeth respectively. The pitch of the screw is ¼ inch and the belt speed is 800 feet per minute. How long will the arm require to rise 40 inches?

**Answer.**—Speed of pulley

$$= \frac{800}{14\times 3.1416}\times\frac{12}{1} = 992.06 \text{ r.p.m.}$$

$$\text{Speed of screw} = \frac{992.06\times 12}{96}$$

$$= 124.0075 \text{ r.p.m.}$$

$$\text{Speed of arm} = \frac{124.007}{4} = 31.0018$$

inches per minute.

Time required to raise planer arm

$$= \frac{1}{31.0018}\times 40 = 1.29 \text{ minutes.}$$

* * *

**Question**—A single threaded mild steel screw with outside diameter of 3⅛ inch has a 5/16 square thread. What length of hold would this screw require to have on the nut in order to make the shearing strength of the thread equal to the tensile strength of the screw not counting tensile strength of thread?

**Answer.**—A screw is usually made to exact dimensions any allowance for play being made in the nut. Length of shearing surface = circumference of screw = 2.5 × 3.1416 = 7.854 inches. Tensile strength of steel = 60,000 pounds per square inch. Tensile strength of screw = 2.5 × 2.5 × .7854 × 60,000. = 294,522 pounds.

Shearing strength = 50,000 pounds per sq. inch.

Shearing surface for every inch of length = 7.854 × .5 = 3.927 sq. ins.

Shearing strength for each inch of length = 3.927 × 50,000 = 196,350 pounds.

Length of screw required

$$= \frac{294522}{196350} = 1.5 \text{ or } 1\tfrac{1}{2} \text{ inches.}$$

* * *

**Question.**—In the above problem, using a safety factor of 4, what length of brass nut would be required to develop the full strength of the screw?

**Answer.**—Shearing strength of brass is 36,000 pounds per square inch. Length of shearing surface = 3.125 × 3.1416 = 9.817 inches.

Shearing surface required

$$= \frac{294522\times 4}{36000} = 32.724 \text{ sq. inches.}$$

Allowing .01 inch play, we have for every inch of length $\frac{.3025}{.625} = .484$ inch of shearing length or shearing surface = .484 × 9.817 = 4.7514 sq. inches.

$$\text{Length of nut required} = \frac{32.724}{4.7514}$$

= 6.89 inches.

* * *

**Question**—What force could be exerted by means of a jack screw, the pitch of which is ½ inch by means of a lever of such length that a pressure of 60 pounds is exerted 30 inches from the centre of the screw? Friction is 48 per cent.

**Answer.**—The load multiplied by the distance through which it moves equals the power multiplied by its distance. The distance through which the power moves = 30 × 2 × 3.1416 = 188.496 inches. The power = 60 pounds. The load moves ½ inch.

$$\text{Load and friction} = \frac{188.496\times 60}{.5} = 22{,}619.5 \text{ pounds.}$$

$$\text{Net force} = \frac{22619.5}{100}\times\frac{52}{1} = 111762.14$$

pounds.

* * *

**Question**—A mechanic uses a 20-inch wrench for screwing down ¾ inch nuts on a cylinder head. Assuming friction to be 72 per cent., and that the nuts are amply strong, what pressure on the wrench would be required to stress the mild steel studs up to the elastic limit?

**Answer.**—For v-thread, the diameter at the bottom of the thread is .5768 inch. Area of this section is .26129 sq. in. Assuming the elastic limit to be half of the ultimate strength, possible load sustained by the bolt is .26129 × 30,000 = 7838.7 pounds.

Circumference of wrench circle is 40 × 3.1416 = 125.664 inches.

A ¾ nut has 10 threads per inch or travel of nut is 0.1 inch per revolution. Speed ratio is therefore 1256.64 to 1, or, taking friction into account. 1 pound pressure on the wrench produces a tension of $\frac{28}{100}\times 1256.64 = 351.859$ lbs.

A tension of 7838.7 pounds then, would be produced by a pull of $\frac{7838.7}{351.859} =$ 22.27 lbs.

* * *

**Question.** A locking device consists of a right and left hand screw of 4 pitch operated by a 10-inch hand wheel and a toggle, each arm of which is 10 inches. What outward force would be exerted by the toggle if 30 pounds be applied to the hand wheel, the distance between the two nuts and the two arms of the toggle forming the side of an equilateral trangle.

**Answer.**—Circumference of hand wheel is 10 × 3.1416 = 31.416 inch. Travel of nuts at one revolution is 0.5 inch. The force tending to draw the nuts together is $\frac{31.416\times 30}{.5} = 188.496$ pounds. Neglecting friction, the thrust = 188,496 × tan 60 deg. = 188.496 × 1,732 = 326.476 pounds.

* * *

**Question.**—A 1-inch nut is 1 inch thick and is tightened down to the full strength of the bolt. Neglecting the thread, how thick should the metal be on the sides to resist bursting?

**Answer.**—The smallest diameter of a 1-inch bolt with a U.S. standard thread is 0.838 inch. Area of section=.838× 60,000 pounds per square inch, the ultimate strength of the bolt = .5515×60,000 = 33,090 pounds. The angle of the thread is 60 degrees. The vertical force must be 33,090 pounds.

The bursting force, which is the horizontal component of the whole force acting at right angles to the face of the thread, is 33,090×tan 30°=33,090× .57735 = 19,104 pounds.

The stress in the nut $= \frac{19{,}104}{2} =$ 9,552 pounds. This, allowing 40,000 pounds per square inch, requires $\frac{9{,}552}{40{,}000}$ = 0.2388 square inches. That is, the nut being 1 inch high, would require approximately ¼ inch of metal, or ⅛ inch on the side, to resist bursting.

## SOME POINTS IN JIG DESIGN.

(Continued from page 50.)

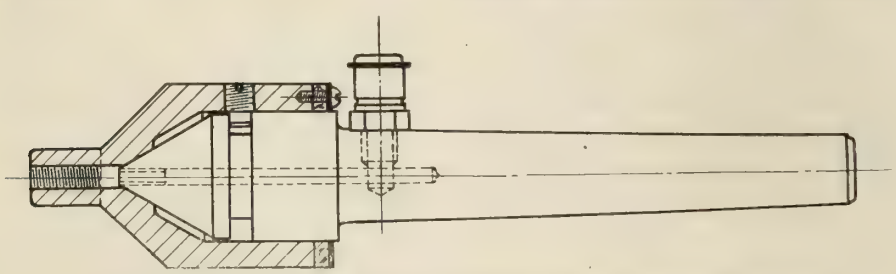
the jig. On the other end of the leaf is placed a shoulder head screw F, fitted to the finger cam G, also located with a shoulder head screw H. These are all made of low grade tool steel hardened and drawn to a dark straw color. The stop pin I, hardened and driven in the frame, locate the work with the aid of three case-hardened, knurled finger screws J.

When the jig is assembled with a sample model in position and locked in the jig, lay out the holes approximately for bushing; drill through the frame and leaf, allowing enough for boring; clean the jig thoroughly and place the original with a female centre in each hole to be bored. Indicate the jig on the face plate, bore and ream these bushing holes to size, and the jig is complete to receive the bushing B.

## LATHE OR GRINDER CENTRE.

By R. G. Dickens.

THE following description of a lathe or grinder centre for hollow cylindrical work may be of interest to readers of Canadian Machinery, having such jobs as automobile wrist pins to finish turn or grind.



LATHE OR GRINDER CENTRE FOR HOLLOW CYLINDRICAL WORK.

The centre is used in one of the largest auto plants in the States, and has been very satisfactory wherever used. It consists of two main parts as shown, both of which are hardened and ground as required, the centre being a good running fit in cap at large diameter, and at extreme point for about ⅜ of an inch.

The various parts are held together by a headless set screw and are lubricated through Winkley oiler as shown. The felt ring is held in place by sheet brass ring and two screws, and is for the purpose of retaining the lubricant and excluding grit and dirt. The general appearance is plainly indicated by the sketch and needs no further explanation.

## HIGH-PRESSURE WATER HEATING.

THE total number of explosions of high-pressure heating coils investigated by the British Board of Trade from the year 1887 to 1913 was 63, says Vulcan, and in no less than 54 cases the cause of the accident was due to the pipes being choked with ice. A few explosions occurred during the month of December, and about double the number in February, but more accidents took place in January than in any other month. These explosions cause dthe death of five persons and injury to 31 others.

The system of heating buildings by water at a high pressure dates back to 1831, when a patent was taken out and was described as "Perkins' heating by small-bore pipes." With the present-day heating coils, there is a good deal of uncertainly as to the actual pressure in the pipes under working conditions. This type of heating is undoubtedly subjected to extreme pressures in the event of the fire being forced or by the circulation defective, as many accidents have occurred by burst pipes, which when new will sustain a water test of 4.000 per square inch. The most common cause of an explosion is the blocking of the pipes by ice in frosty weather. Imperfect circulation of the water and the presence of air in the pipes is another source of danger.

### System in Simple Form.

The most simple form of this system of heating is a coil of piping at the furnace, the upper end being led round the building, returned and attached to the lower end of the coil. The piping is filled with water and sealed, the coil encased in brickwork or a casting, and the usual firebars and firing door fitted. With some makes the boiler portion is composed of pipes of larger diameter fitted in the form of a letter A, the cross bar of the A being the fire bars or grate. In another form the larger tubes at the furnace end are fixed horizontally in the form of a circle with the the fire inside or underneath. The smaller tubes are about 1 5-16 in. outside diameter and ⅞ in. bore, and are generally wrought iron and lap welded longitudinally, the connections being made of strong unions screwed with a specially fine (15 to the inch) right and left handed thread. The ends of the tubes are also arranged to make a metallic joint when butted together.

Provision is made at the highest point of the system for the increased volume of water in the pipes through expansion when heated. This is called the expansion chamber or pipe, and is usually about three to four inches diameter and from three to six feet high. The expansion pipe should be fixed vertically above the filling pipe, which is a short vertical branch fitted with a screwed plug, and should also have a screwed plug at the side to prevent over-filling. This should be removed when the pipes are filled up. Some makers, however, do not fit expansion pipes, and in their place the upper end of the system is connected to a small safety valve with an inlet valvet beneath. Both these fittings are immersed in a small tank of water and the safety valve is supposed to act in the event of over-pressure or excessive expansion and the inlet valve to supply the necessary water to the system when the pressure and heat have gone down. The safety valves range from ⅛ in. to ¼ in. in diameter and are loaded to 500 to 1.000 lbs. per square inch or more. Occasionally both expansion pipes and safety valve are fitted, but generally only expansion pipes are fixed, these being not so liable to get out of order as the combined safety and inlet valve.

### Filling the System.

The pipes are originally filled with water by means of a force pump; the pump being attached at the extreme low point near the furnace where there should be a special branch for the purpose. This method of filling is to avoid, if possible, air pockets forming in the pipes which would be more likely to occur if they were filled from the top. Most makers also advise that the pipes should be pumped through every year for the purpose of driving out any air that may have accumulated. The filling pipe previously referred to at the top of the system is merely a replenishing convenience, and should be used about once a week. The volume of the expansion pipes is generally taken at about ⅛ or more the capacity of the whole piping, so that in a system of, say, 1.000 feet of piping at ⅞ internal diameter, about six feet of expansion pipe 4 in. diameter would be required. It is also usual to use about one-tenth of the piping around the furnace which, in larger installations, would range from 200 to 300 feet.

# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## AUTOMATIC TAPPING MACHINE.

THE three machines illustrated were made by the Garvin Machine Co. of New York city, and are the latest additions to their well-known line of automatic tapping machines. Fig. 1 shows their No. ½ combination automatic tapping machine, which is virtually their No. 2 machine equipped with a No. 1 head and which meets the need of a machine for work having two holes of such a difference in size that it would

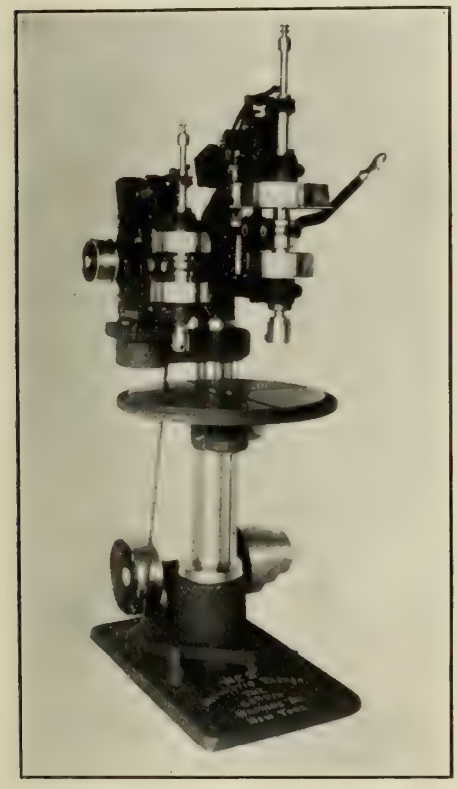


FIG. 1. NO. 1-2 COMBINATION AUTOMATIC TAPPING MACHINE.

not be practical to have both heads of the same capacity. The No. 1 head, it will be noticed, can be operated either by lever or foot treadle, while the No. 2 head is operated by lever alone. Each head is independent of the other.

Fig. 2 is their No. 1-2-X, combination automatic tapping machine, showing another combination of the No. 1 and No. 2-X sixes of heads. Both heads are operated in this instance by foot treadle, leaving both hands of the operator free, and the No. 2-X head is of greater capacity than the No. 2 head on the machine previously described.

Fig. 3 illustrates their No. 2-X four spindle automatic tapping machine. The spindles are operated in pairs, and are controlled by independent lever, the two on the right being used for rough tapping and the two on the left for finishing. The work consists of a deep hole in tool steel, necessitating rought tapping before finishing, this being done with but one clamping. The fixture is moved along the slide from one pair of spindles to the other. The general operation of these machines is the same as the firm's regular automatic tapping machines. The spindles are fitted with two friction pulleys running in opposite directions and, after the top is once started, the machines work automatically, tapping the hole to a predetermined depth, controlled by automatic trip, and reversing the tap.

## HIGH-SPEED ELECTRIC LOCOMOTIVES.

DURING 1914, sixteen high-speed electric locomotives have been placed in main line passenger service of the New York Central Railroad. This type, states the Railway News, is claimed to be the most powerful electric passenger locomotive thus far constructed, and is capable of continuously hauling a train of fourteen steel Pullman cars at a sustained speed of 60 miles per hour. With lighter trains the maximum speed of these locomotives is 85 miles per hour. The electrical features are generally the same as in the original electric locomotives first operated by the company eight years ago.

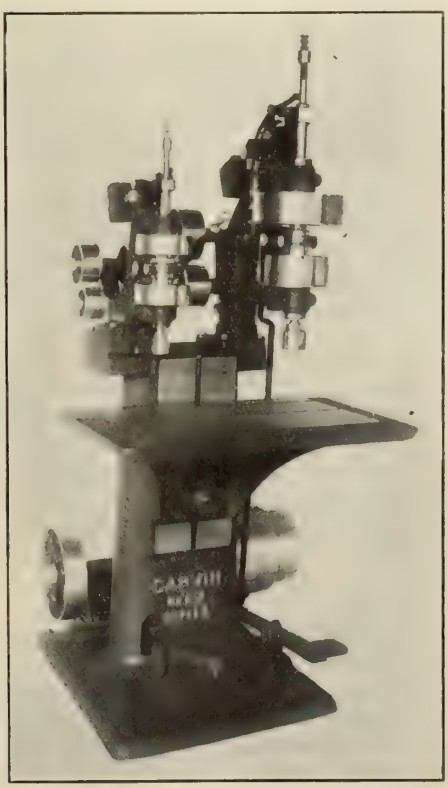

FIG. 2. NO. 1-2-x COMBINATION AUTOMATIC TAPPING MACHINE.

The new locomotives weigh 132 tons and the great increase in capacity, compared with the comparatively slight increase in weight, is due to the fact that motors have been placed on the axles of the leading and trailing bogie truck wheels, thus avoiding all dead weight, all the wheels being driving wheels, the

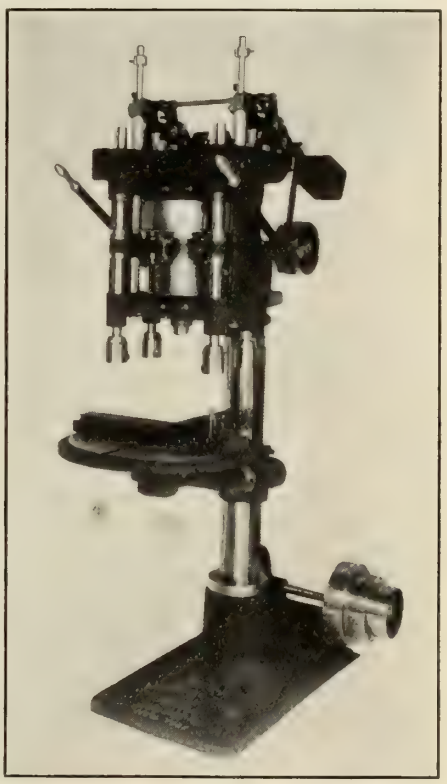

FIG. 3. NO. 2-x FOUR SPINDLE AUTOMATIC TAPPING MACHINE.

entire weight of the locomotive being thereby available for producing tractive effort or draw-bar pull.

## THE NEW WILLSON GOGGLE.

T. A. WILLSON CO., Inc., Reading, Pa., have recently placed on the market a new goggle specially designed to meet the requirements of machinists and grinders. This goggle has a unique construction, and is claimed to offer workmen complete comfort and perfect eye protection.

By the use of a special frame design, this goggle is made light in weight, yet substantial, due to sturdy eye wire, temples, etc. It will stand rough shop usage. An adjustable bridge enables the wearer to easily fit the glasses to his

face. This bridge is pliable, strong and securely attached to the eye wire, and does not touch the top of the nose at all, but the weight of the glasses is distributed over the sides of the nose and cheeks. Not resting on the nose, the glasses can be worn right over spectacles.

It is of the greatest importance that grinders and machinists be protected from dust, emery, and grit, which whirl around the sides of glasses. Side guards are necessary, and the light fine mesh wire sides of the Willson goggle contribute to complete protection, and are at the same time comfortable. Fine quality glass is used to insure freedom from eye strain.

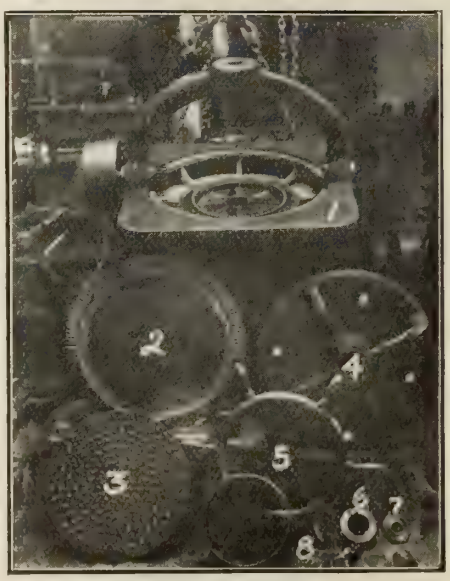
Being made entirely of rust-proof metal, this goggle is perfectly sanitary, and can be thoroughly sterilized. Comfort is further assured by the flexible half cable temples, which easily conform to any face, and do not pull or cut into the ears. Lenses can be easily and quickly replaced by simply loosening one of the screws of the end piece.

## A NEW FACER BUFFER AND POLISHER.

THE straightening of flat or dished disks by hand is a tedious and difficult process and has, in fact, been regarded as a trade in itself, particularly when applied to circular saws and similar plates which require not only to be trued up but to be given a certain initial tension. In the accompanying illustration, is shown a machine designed for this purpose. It is properly known as a ball bearing, double plate rotary facer, buffer and polisher and was designed by Wm. Gibbs, of Brantford, for the purpose of straightening and polishing disk plats for plows, seed drills, plough coulters, grinder plates, saws, etc. Any disc up to 18 inches in diameter and up to $\frac{1}{4}$ inch thick can be conveniently handled by the machine.

The body of the machine is shown by numeral (1). This contains the grooved ball race which supports the bottom revolving plate upon a large circle of $\frac{5}{8}$ balls. This plate along with the upper revolving plate is driven by bevel gears attached to their outer edges. The driving is done by the small bevel pinion between the two plates as shown which obviously causes them to rotate in opposite directions. The bottom plate contains a 4-inch boss which fits into a corresponding depression in the base of the machine and, of course, is fitted with the steel ball race; the whole running in a bath of oil and giving a solid and uniform bearing capable of carrying a working load of seven tons.

The peining or straightening is done by the plate (3) which contains a large number of spirally arranged, hardened balls and the spiral arrangement insures that no two balls follow exactly the same circle on the disc. The effect of thus rolling the plate is to place every part of the surface under a uniform tension and it leaves the machine, after 15 seconds treatment, perfectly flat and straight. The upper plate is shown at (4), while at (5) is the hand wheel for adjusting the pressure between the plates. At (6) is shown half of the small nut with the groove (7) in the upper half; (8) is a roller bearing supporting the screw. The weight of the complete machine with all attachments is 1,350 pounds.



BALL-BEARING BUFFING AND POLISHING MACHINE.

The machine is driven by a belt so as to give either a polishing or a rolling speed. The work to be straightened and polished is first placed between the ball plates and sufficient prssure applied by means of the hand wheel and screw, this depending upon the nature of the material. After the batch has been thus peined at a speed of 300 r.p.m., the ball plates are exchanged for emery discs, the machine speeded up to about 1,800 r.p.m., and the work polished under a comparatively slight pressure. This change is accomplished in about five minutes by removing the four bolts shown by numeral (4). The whole constitutes a machine covering a wide range of difficult work and occupying little floor space.

## TYPES OF SHELLS.

THERE are in use in the British navy at the present time three different kinds of shell. Each type has its own distinctive duty to perform, and the work done by each is as follows:

Armor piercing shell.—Inflicting a fatal blow on the enemy by damaging a vital part. Since these parts are all protected by armor the shell has to pierce the armor before it can be effective.

Common shell.—The destruction of material.

Shrapnel.—Man-slaying.

The early armor-piercing shells were made of cast iron, which, when wrought iron armor was introduced, were hardened at the points by a patent process. When compound armor was fitted, these shells were made of forged carbon steel. With improvements in armor, shells were required of correspondingly harder material, and various quantities of nickel, chromium, and sometimes tungsten, have been used with success.

Each country has a secret process for manufacturing its armor-piercing projectiles, which has for its purpose the hardening of the head and the tempering of it in such a way that the rear portion is reduced in hardness and rendered very tough. The cavity of these projectiles is filled with a small bursting charge, varying between two and three per cent. of the weight of the whole projectile. These shells, whether fused or not, burst on striking armor of medium thickness. With all the improvements in armor-piercing shells, they cannot be reckoned as capable of piercing armor of more than a calibre in thickness.

Common shell generally carries an enormous bursting charge of melinite, lyddite, or some such explosive. They burst into small pieces, and are used for the destruction of material.

Shrapnel, which is filled with bullets, is essentially a man-slaying projectile, the explosion of the charge in the base of the shell driving the contents forward, and sweeping a wide area.

## DECEMBER TRADE DECREASE.

A FURTHER decrease in Canadian trade is indicated by the December trade statement just issued by the Minister of Customs, Hon. J. D. Reid. Imports dropped about $22,000,000, the figures for December of this year being $31,454,883, as compared with $52,571,831 last year. Exports were $37,513,624, as compared with $55,803,676 in the corresponding month last year.

On the other hand, there was an increase in the exports of manufactured goods of $2,000,000 in December and $12,000,000 for the nine months of the fiscal year. There has also been an increase in the exportation of animals and animal products, though that of other agricultural products has decreased.

The balance of trade against Canada is gradually decreasing, December exports being $6,000,000 greater than imports, although the latter total has been swollen of late by importations of coin and bullion.

## THE DEPRECIATION OF THE HUMAN FACTOR.

IN connection with recent controversies relating to the trying out of men in many capacities before adopting the last resort of discharging misfits, and the cost of hiring and firing men, the least of attention seems to have been given to the "choosing" feature. It would seem that the advocates of certain systems of handling help are going so far as to devise plans of entirely doing away with the rule of the survival of the fittest.

The choosing of men whose natural tendencies make them more suitable for certain kinds of physical and mental activity has recently been declared to be an extremely simple matter based upon an exact science. Whatever may be the methods adopted for bettering the help it is assuredly much easier to improve upon a good thing than to make an efficient man out of one who has no natural bent in the desired direction. In a recent visit to one of the largest vehicle factories in Canada, we noticed a caretaker who was so corpulent as to be unable to bend over to pick up articles from the floor. Again one of the best salesmen window-dressers of our acquaintance was once discharged after many trials, from a machine shop as being an absolute misfit.

It is reasonable to suppose that good or bad tendencies become part of one's physical as well as one's mental make-up and that they are represented in the face, actions, handwriting and in other ways to those versed in the science of character reading by unmistakable signs. It is a fact that the applicant does not always know his own best accomplishments and is often forceful in declaring what he would like to do rather than what he can do.

Whether credence is given to the scientific side of this part of the work or not, it is certain that the choosing of help is work that is worthy of the shrewdest judgment and long experience, and is no job to be entrusted to the office boy or his equivalent. One manager, to our knowledge, has accomplished much by encouraging the gateman of the employment office to take up this study so that only suitable applicants are sent on to the department heads. The figures given as to the cost of training an average applicant are somewhat alarming. In the same proportion, the cost of trying out a misfit would pay for a very large amount of prevention in the way of study on the part of the man who chooses the help.

IT is a perilous business—this ready condemnation of other people, and invariably indicates tactlessness, stupidity and gross ignorance. In its own little world, it however betokens smartness.

• • •

"As a keeper of the peace international trades-unionism has been a failure," says a contemporary. As far as keeping the peace is concerned everything has failed, but at least nobody can say that trades-unionism caused the war.

• • •

Industrial peace prevails in Canada at the present time, only one conciliation board having been constituted lately, to deal with a dispute between the city of Edmonton and its electrical employees, Judge Hyndmas is chairman.

• • •

Nobody knows what this war will cost Canada, but everybody, like the Reeve of Stayner, expects that it will cost a good deal. The Orillia Packet reports that the Reeve of Stayner complained at the Simcoe County Council that "this thing has cost me ten dollars already, and may cost me ten more before it is over."

• • •

HOUSE rents in our principal Canadian cities are, generally speaking, less now than they were a few months ago, but so is the capacity to pay them. The reduction exceptions are to be found among corporations who among other activities administer properties, estates, etc. Whatever may have been the cause for dubbing Toronto with the somewhat ignominious title of "hog town," there is ample evidence that some types of landlordism at this crucial time are no mean exponents of its altogether appropriateness.

# The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

**Montreal, Que., Jan. 18, 1915.**—There seems to be a better tone generally throughout the iron and steel markets. With the opening of the new year, business was dull from the holiday reaction, but it has been gradually growing livelier and improving in all branches. The present increase in business is tending to bring matters, in some lines, up to normal. In the United States the outlook in the steel industry is improving. Pig iron and foundry supplies are, however, rather quiet. The machine tool business is also quiet and appearances are that they will remain so for some time yet. The Canadian railways still report a shortage in freight movements.

The manufacture of shells in Canada has become more and more prominent of late because of the extensive orders placed. The steel companies have made special dies, and many shops have either increased their equipment or rearranged that existing, so as to further compass economical production. Many plants have had designed special machines to handle expeditiously several of the subsidiary operations.

### The Steel Market.

Improvement in nearly all lines is the report of the steel industry. The most encouragement has come from the United States centres. Railway corporations are entering the market for steel products very freely, there being huge orders on the books of the various car shops at present. Locomotives are in demand also. Recently the Pennsylvania Railway placed on order for 175,000 tons of steel rails, which is quite up to their normal demand. Evidently these large corporations have confidence in the outlook for business in 1915. Canadian steel companies report business on the increase, and also that the number of inquiries show a like development. In the course of the next two months the Algoma Steel Corporation expect to commence operations. Structural sections are not moving very freely, but this is about the only department of the steel trade that is dull. The improvement everywhere is general, and apparently more or less permanent.

### Pig Iron.

The pig iron and iron ore market con-

tinue dull, importation of either having practically ceased.

**Machine Tools and Supplies.**

The machine tool business has been stimulated more or less by the orders placed for the manufacture of shells. Supplies have been similarly affected. General conditions are, however, rather dull, although not by any means as quiet as anticipated. Sales for the most part are for one or two tools at a time. Supplies have more than held their own ever since the orders for shells were placed.

**Metals.***

Many interesting features in the metal markets have presented themselves during the week. In spite of pending investigation into the matter of searching American ships for contraband, the price of copper, one of the principal items of the controversy, remains about the same, there being a small advance recorded. The inference to be drawn is that the copper magnates in America do not anticipate any further trouble. If the shipments of copper fell off, the accumulation in the United States would immediately cause the price to tumble.

Spelter is not undergoing much change at present, and the price remains at the same level. Tin is strong, and although no price change has taken place, the tendency is for it to stiffen considerably.

Lead is somewhat duller than the other metals. The price has sagged a little, due largely to the fact that the usual industries which consume the most lead in times of peace are not now operating to full capacity. The uses for ammunition are not sufficiently great to make up for the lack of consumption, so the supply is in excess of the demand.

Aluminum is quiet. Antimony is now very scarce on this continent, and the price is high. At the present time supplies of antimony from England or France are practically unobtainable, the allies requiring all of it for munitions of war. Russia has evidently contracted for all the supplies from China and Japan.

*British advices just received state that copper jumped up 20 shillings per ton to-day.

---

**Toronto, Ont., Jan. 19, 1915.**—Industrial conditions are pretty much the same as they were last week, trade not having developed any marked activity since the beginning of the year. At this period business is generally quiet, only this year it is rather more so than usual. Manufacturing establishments, except those engaged on war office orders, are quiet, consequently their requirements for materials are considerably reduced. The former on this account have to exercise due economy in order to conserve their resources. The uncertainty of the outlook for the immediate future makes this more or less imperative, but in the long run the effect will be beneficial. On the other hand, factories producing war equipment are working to capacity, and are likely to continue so for some time to come.

The need for increased revenue to meet the heavy demands on the Dominion Treasury for outfitting the overseas contingents has been the cause of some speculation as to the means to be employed for meeting this condition. It is rumored that there will be a revision in the customs tariff, but no information of an official nature is available. It is, however, having a rather unsettling effect in business circles, although contracts are as a rule being made subject to tariff changes. The latter will, therefore, in a measure, be anticipated.

Officials of the Canadian railway systems are considering the question of increasing freight rates in Eastern Canada. It is reported that a petition will be submitted to the Board of Railway Commissioners to indorse the application on account of the increase in operating expenses and decrease in receipts on account of the smaller volume of business.

With regard to the iron and steel trade there is little improvement in the situation and business is dull; the same may be said of pig iron. There is a slight improvement in the demand for metals. Copper and spelter are stronger and have advanced slightly, otherwise the markets are steady. The price of scrap copper has advanced in sympathy with the copper market but business is light. There is considerable activity in machine tool circles on account of inquiries for shell machinery and some nice business has been closed.

**Steel Market.**

Conditions in the iron and steel trade continue dull, generally speaking, although there is some activity on account of the orders for war material, principally shells. The Nova Scotia Steel Co., it is reported, will blow in a blast furnace shortly, their open-hearth furnaces being already in operation. This company is engaged on large orders for shell forgings. The Dominion Steel Corporation is installing twelve wire-making machines. This concern has been for some time working on large orders for wire and wire products for the British Government. The order for rails booked by the Algoma Steel Co., of Sault Ste Marie, Ont., and reported in the last issue of Canadian Machinery consisted of 17,700 tons distributed among the following railroads: Pere Marquette, 8,000 tons; Michigan Central, 6,000 tons; Big Four (C.C.C. & St. L.), 1,700 tons, and 2,000 tons for the New York Central. The price for the most part is $25.50 at the mill. There is, however, little demand for steel products for ordinary purposes. The building trade is very dull and the majority of manufacturing establishments using steel products are not working at anything like the normal capacity. There has been no change in prices this week, although the market is firmer.

The market at Pittsburg is quieter, and the amount of new business has fallen off. The mills are increasing their output slightly and an optimistic feeling prevails regarding the outlook. Prices are unchanged on bars, plates and shapes.

**Pig Iron.**

There is nothing of interest to note in the pig iron market; business continues dull. Now that inventory-taking is over it is expected that there will be some buying, although perhaps of a light nature.

**Machine Tools.**

The orders for shrapnel shells are the most interesting feature in the machine tool business at present. Inquiries are constantly being received by local machinery houses for grinders, automatics, etc., for machining shells, and a number of sales have been made. There is more activity in machinery circles now than there has been for many months, almost entirely on account of the shell business, which will develop as the number of firms receiving orders increase. Apart from this particular line, however, business is quiet.

**Supplies.**

The market for machine shop supplies is quiet, although there is a certain amount of business passing, orders generally being for small lots. There have been no price changes except in linseed oil and turpentine which have both advanced. Oil is now 64 cents per gallon, having advanced 6 cents during the week on account of the high price of flax seed. Notwithstanding the light demand, the market is firm and may go higher in the near future. Turpentine advanced 1 cent, and is now being quoted at 64 cents a gallon. The demand is light, but the market is strong with an upward tendency. A reduction in the price of cotton waste may be expected any time now as cotton has declined in price.

**Metals.**

There is a slightly improved tone in the metal markets this week, although the demand is still comparatively light. Prices are holding firm generally, and in the case of copper and spelter have advanced. The copper situation is unchanged as regards exports. The market is strong and prices have advanced ¼c per pound, lake copper being now quoted at 14.25 cents per lb. The tin market is dull and featureless, but the price is firm at 36 cents per pound. The primary market for spelter is strong and the price has advanced ¼c., being now quoted at

6.25 cents per pound. The lead market continues dull and quotations unchanged at 5c per pound. The antimony market is stronger, due to increased demand, and the metal is in a strong position. The price is firm at 18c per pound, with the prospect of an advance. Aluminum is unchanged at 22c per pound.

**Scrap Metals.**

The continued strength in the copper market has caused an advance of ¼c per pound in the price of scrap copper. The new quotations read as follows: Light copper 9c, heavy 10c, wire 10c, No. 1 composition 9c, and turnings 8½c per pound. Brass clippings have advanced to 8c, and scrap zinc to 4c per pound. Other prices are firm and the demand generally is light.

## FREDERICTON, N.B.

BUSINESS in Fredericton and vicinity continues very good, factories are running as usual and there is very little unemployment. At the present time about a dozen buildings are under way, including a concrete warehouse. It is probable that the antimony mines at Lake George, about 18 miles from the city, will soon resume operations, the price of this material having more than doubled since the outbreak of the war.

The New Brunswick Government has decided to suspend, during the war, that provision of the law prohibiting the exportation of timber for pulp purposes, cut on Crown lands of the Province, so far as relates to Great Britain. This will allow pulpwood and pit props, cut on Crown lands, to be shipped there.

New Brunswick is more fortunate than any other Province in the Dominion this year, in having universally good crops. The possibilities of sheep raising are being examined by farmers from provinces further west, the moist climate, conformation of the country, and absence of drouths, being favorable for same.

The operation of the St. John Valley Railway between Fredericton and Centreville began on December 18, and the service from Fredericton to Gagetown, it is expected, will be begun before the end of the year. Some of the most fertile farming areas will be found along the route of this new line. It is thickly settled throughout, and much traffic has been awaiting the opening.

## NEWFOUNDLAND TRADE DECREASE.

THE first decrease in the total business of the Colony of Newfoundland, indicated by the annual figures of exports and imports, in more than a decade, is shown by statistics for the last fiscal year, made public a few days ago. Although exports increased by $461,654, there was a decrease in imports of $1,018,639, the total figures being: Exports, $15,134,543; imports, $15,193,726.

Shipments to the United States showed a falling off of $348,895, due to inability to market as large quantities as usual of sealskins, cod liver oil and other fisheries products. The United States was the only country from which imports were greater than in the previous year, the increase being $223,163.

The higher prices prevailing for fish brought about an addition of $547,507 to the value of exports to South America, the West Indies and Mediterranean ports.

Chiefly because of the war, all industries in the colony, except the pulp and paper mills, have diminished their output. A wider market for fish is anticipated this year, in view of the absence of French competition in the Atlantic cod fishery, resulting from the drafting of the French fishermen to serve on warships.

### THE ONLY WAY.

**In his recent message to Congress, President Wilson summed up his thoughts about the war in the expression of an earnest hope that the United States might have an opportunity of bringing about peace and reconciliation. The hope is worthy of his heart, but it is futile, for in this struggle the allied peoples are resolved to make a settlement with the common enemy in their own way and in their own time. Peace will not come until the foundations of a peace that will endure have been laid. This is not a war between small States which can only reap the harvest of victory or be saved from the direst consequences of defeat by the benevolent intervention of mighty neighbors. It is a war between armed arrogance and brutality and the liberties of Europe, between the claims to a military dictatorship and the claims of nationalties to the freedom of their own existence The Allies are the full-grown men of Europe who know the tremendous import of the issues and have united their powers and their resources with the one object of winning decisively. It is "a fight to the finish." There is no place for the mediator, and there will be none. This is one of the fundamental facts which must be accepted without question by the neutral world.—G. H.**

## CANADIAN VICKERS BUILDING SUBMARINES.

THE fact that the Canadian Vickers Co., Montreal, is engaged in constructing submarines for the British Government has been known for some time, but at the request of the Government public notification earlier has been withheld.

The censorship established by the Government has been unable to prevent the news appearing in United States papers, hence, to offset the exaggerated stories which these have published, the Department at Ottawa have given out the following statement:—

The keels for eight first-class craft of the submarine type have already been laid down by the plant, and it is expected that several will be ready by August next.

## SUBMARINES IN THE WORLD'S NAVIES.

THE following is an approximate list of the number of submarines possessed by the various countries:

| | Built. | Building. |
|---|---|---|
| Great Britain | 75-80 | 16 |
| Germany | 35-40 | 12 |
| France | 70-75 | 12-20 |
| United States | 40 | 15 |
| Italy | 19 | 7 |
| Japan | 15 | 2 |
| Denmark | 8 | 4 |
| Holland | 10 | 2 |
| Sweden | 7 | 3 |
| Norway | 2 | 3 |
| Greece | 2 | 1 |
| Brazil | .. | 3 |
| Chili | 2 | .. |
| Peru | 2 | .. |

## C.P.R. BOOSTS FREIGHT RATES.

NOTICE was given by the C. P. R. at Montreal on Jan. 13, of increased freight charges for goods exported to the United States. This is in line with the recent announcement of an advance of 5 per cent. to be made. The domestic rate for grain to Boston and New York will be 18.3 and grain products 18.8 per hundred, instead of present rates, 17.5 and 18. The rate on news print paper from the mill goes from 18. to 18.9 per hundred.

The new schedule will be effective about February 15. The rates for branch lines will range from 18.8 to 19.2, according to location. Lumber rates will be raised later on the same basis of five per cent.

**Capt. Gideon Adams**, of the Government steamer Reserve was accidentally drowned at Prescott, Ont., on Jan. 16.

# TRADE, COMMERCE, AND TRANSPORT

Embracing Statements of Manufacturing Output, Records of Imports and Exports, Company Statistics, Provincial Revenues and Trade Possibilities, Etc.

## MONTREAL & SOUTHERN COUNTIES RAILWAY IN 1914.

DURING the past year, the Montreal & Southern Counties Railway made another extension to their interurban system by the electrification of nine miles of steam track, extending from their former terminus at Marieville in an easterly direction, through Rougemont—at the foot of the Rougemont Mountain—to the town of St. Cesaire. In order to conform to the new standard, this section was completely rehabilitated prior to electrification. The bonding consisted of 4/0 jumper bonds 28 in. long, of the compressed terminal type, with 2/0 cross bonds every one-quarter mile.

### Overhead Construction.

The overhead construction is of the standard catenary type, consisting of 7/16 in. Siemens-Martin grade 7-strand galvanized steel messenger cable, from which is hung at intervals of 15 ft. on tangents a 4/0 B. & S. gauge American Standard grooved hard drawn trolley wire. The hangers are of the floating type, specially designed to absorb the shocks in transit, and consist of a three-bolt malleable iron Detroit type of ear to which is rivetted a ¾ in. wide, ⅛ in. thick, strap iron hanger. Forty foot 7 in. and 8 in. top cedar poles are used, spaced 150 ft. apart on tangent, and 105 ft. and 90 ft. apart on curves according to the degree of the latter. On tangent tracks a clearance of 9 ft. from center of track to centre of pole is maintained, while on curves this clearance is increased six inches.

The bracket type of construction was employed wherever possible, and consists of a 10 ft. T iron bracket attached to the pole, on which is located a malleable pin and porcelain insulator which carries the messenger wire. The messenger wire is allowed to ride free in the recess in insulator, which allows of free adjustment of line between the anchor, which anchors are located every half-mile. Cross span construction is employed throughout the yards and on several of the curves which require that type of construction. The miscellaneous overhead material was supplied by the Ohio Brass Co., and is all galvanized and sherardized. The hard-drawn trolley wire was supplied by the Standard Underground Cable Co., and the Canada Wire & Cable Co. Special steel messenger cable was supplied by the Steel Company of Canada.

The 4/0 trolley wire is supplemented along its entire length by an 816,000 C. M. aluminum feeder. This feeder gives a capacity more than enough for ordinary daily requirements, but was installed to take care of additional freight locomotives and also to handle the extra winter equipment such as sweepers and rotary plows. The feeder cable is supported on glass insulators, which in turn are carried on standard oak pins, supported on a 3½ in. x 4¼ in. x 4 ft. pine cross arm attached to pole with galvanized braces. On all curves the cross-arms are doubled and malleable iron pins are used instead of oak.

The feeder is tapped to the trolley every quarter-mile, and at each of these points Garton-Daniel lightning arresters of the 750 V type are installed. The feeder taps consist of 2/0 standard weather proof wire terminating in a feeder ear attached to the trolley and a 4-bolt aluminum clamp attached to the feeder. All aluminum feeder and clamps were supplied by the Northern Aluminum Co. The telephone despatching system already in use on the road, consisting of the Northern Electric & Mfg. Co. selector type, was extended from Marieville to St. Cesaire.

### Transmission Line.

The electrification of this additional stretch of line necessitated the building of another sub-station, which was located at Rougemont. Moreover, as the Montreal Light, Heat & Power Co. did not operate in this vicinity, it was necessary for the Montreal & Southern Counties Railway to construct a private transmission line from the hydro-electric plant of the Montreal Light, Heat & Power Co. located on the Richelieu River to the proposed sub-station, a distance of 12 miles.

This transmission line is carried across country from the hydro-electric plant to where it intersects the Montreal & Southern Counties right-of-way, just east of the station at Richelieu, and from that point to Marieville it is carried along this right-of-way on a separate pole line. At Marieville, the separate pole line is disposed of, and the transmission line is carried on the top of the bracket poles.

The standard construction adopted for this transmission line consisted of 3¾ in. x 5 in. x 5 ft. yellow pine cross-arms spaced 4 ft. C.C., securely bolted to pole with ⅝ in. x 14 in. galvanized machine bolts, to which are bolted 2½ in. x 2½ in. x ¼ in. angle braces. The insulators are of the Locke No. 311 type supported on Locke No. 22 pin with porcelain base. These insulators are placed 4 ft. C.C. On the upper cross-arm is carried one phase and the ground wire, while on the lower cross-arm is carried the remaining two phases. No. 4 B. & S. guage hard-drawn copper wire is used for transmission, while No. 8 B.W.G. galvanized iron wire is used as ground wire. This ground wire is grounded every fifth pole. The power as received from the Montreal Light, Heat & Power Co. consists of 3-phase, 63 cycle, alternating current at 25,000 volts.

### Sub-station.

The sub-station constructed at Rougemont is a concrete, steel and brick building 38 ft. x 44 ft. and 17 ft. 6 in. high, with a pent house 8 ft. x 15 ft 6 in. built as a second storey to allow for the entrance of the high tension wires. This building was constructed by A. F. Byers & Co., Montreal.

The electrical equipment of this sub-station was supplied by the Canadian General Electric Co., and consists of a 450 h.p. 3 phase, 63 cycle, 2,300 volt, 10 pole induction motor direct connected to a 300 k.w., 600 volt, compound wound, direct current, interpole generator. Power is supplied to this set from 3 150 k.v.a. delta connected, oil insulated, self-cooled transformers, with primary taps for 25,000 v, 23,000 v, 21,000 v, 19,000 v, and 2,300 volts secondary.

The remainder of the apparatus consists of an A.C. and D.C. switchboard.

2—2,200-100 volt, 50 watt, 60 cycle, potential transformers.

3 sets of S.P.S.T. 35,000 volt, 300 amp. front connected disconnecting switches.

1 set 25,000 volt, 200 amp. choke coils.

1—T.P.S.T. 45,000 volt, 300 amp. K21 automatic oil switch.

1—3-phase, delta aluminum cell lightning arrester for use on 25,000 volt circuit.

This station was put in operation during the month of June, and has taken care of the service without interruption up to the present time.

### Rolling Stock.

At the beginning of the year 1914, an order was placed with the National Steel Car Co. for ten new cars, in order to take care of the additional traffic which it was evident the company would be called upon to handle, due partly to the extending of their service, and partly

to the ever increasing business as people along the line become educated in the uses of an interurban system and realize the advantages it holds for them.

This order consisted of 6 motor cars, 2 trailers and 2 baggage and express cars. The motor cars and trailers are 54 ft. 6 in. long, completely equipped with toilets and water-cooler for an interurban service. The baggage and express cars are 49 ft. 4 in. long and equipped with double-end control. The electrical equipment of all cars consists of Westinghouse 306 interpole motors with H.L. multiple unit control, and the air brake equipment of Westinghouse A. M. M. type with train line for the operation of multiple units. The Westinghouse latest type of synchronizing system is used in the opening of compressor switches so that all compressors in train are cut in simultaneously. The equipment has been in operation now for five months, and is all that could be desired in an electric car.

**New Extension.**

While electrification of the line between Marieville and St. Cesaire was in progress, the Montreal & Southern Counties Railway had their engineers in the field surveying a direct route from St. Cesaire to Granby, a distance of 16½ miles. This line as finally located passes through the village of Abbotsford, noted as a fruit and dairy centre, and thence to Granby, a town with a population of about 6,000 people.

The first work on this new extension was commenced during the winter of 1913, when a contract was let to Ross & McCombe for the construction of two piers and two abutments in the Yamaska River, containing 1,600 cubic yards of concrete. The superstructure is of the deck plate girder type, consisting of three 80-ft. spans, with timber trestle approaches on both sides. The steel for this bridge was furnished and erected by the Hamilton Bridge Co.

The bridge was completed in the spring of 1914, at which time a contract was let to Grant, Campbell & Co. for all grading and timber work, and the laying of steel. Work on this contract was commenced on May 25, and sufficient force was employed to have the road complete and ready for operation by October 15. On August 5, however, all construction work was suspended, due to the effect of the European war on the money market, leaving the entire line practically graded and track already laid within the city limits of Granby.

In accordance with the agreement between the corporation of Granby and the Montreal & Southern Counties Railway Company, steel poles set in concrete were installed throughout the city, direct suspension cross-span construction to be used within the city limits. On the main line between St. Cesaire and Granby, standard catenary construction will be employed similar to that in vogue on the rest of the line.

Another sub-station is to be built, just outside the city limits of Granby, in conjunction with a car barn capable of storing six cars. The present equipment of the sub-station will be one 400 k.w. motor-generator set with all necessary auxiliary equipment, but sufficient space will be provided for an additional unit of like capacity.

## U.S. PIPE, TUBE AND SHEET PRODUCTS.

**DURING** 1913, the United States production of wrought iron, steel and cast iron pipe, boiler and seamless drawn tubes, and galvanized sheets was as follows, according to special statistical bulletin No. 10, recently issued by the American Iron and Steel Institute.

**W.I. and Steel Pipe and Boiler Tubes.**

The production of wrought iron and steel pipe and boiler tubes in the United States in 1913 amounted to approximately 2,245,532 gross tons, of which about 276,067 tons were iron and about 1,969,465 tons steel. Of the total 830,472 tons was black standard pipe, of which 120,619 tons were iron and 709,853 tons steel; 266,940 tons were galvanized pipe, of which 25,323 tons were iron and 241,617 tons steel; 841,089 tons were oil country goods, of which 84,778 tons were iron and 756,311 tons steel; 179,211 tons were O. D. and miscellaneous pipe, of which 2,159 tons were iron and 177,052 tons steel; and 127,820 tons were boiler tubes, of which 43,188 tons were iron and 84,632 tons steel.

Of the active plants, 2 were located in New York, 15 in Pennsylvania, 2 in West Virginia, 5 in Ohio, and 1 in Illinois. It was necessary to estimate the output of two plants. Four plants were idle during the whole of 1913—2 in Pennsylvania and 2 in Illinois. There were 19 plants in 5 States which made iron or steel black standard pipe, of which 1 was located in New York, 10 in Pennsylvania, 2 in West Virginia, 5 in Ohio, and 1 in Illinois. Ten plants made boiler tubes, of which 1 was located in New York and 9 were in Pennsylvania.

The production of hot-finished and cold-drawn seamless steel tubes in the United States in 1913 amounted to approximately 108,567 gross tons, of which about 42,740 tons were hot-finished tubes and about 65,827 tons cold-drawn tubes. It was necessary to estimate the output of a few plants. Of the active plants in 1913, 6 were located in Pennsylvania, 1 in Ohio, 1 in Michigan, and 1 in Wisconsin.

**Iron and Steel Galvanized Sheets.**

The total production in the United States in 1913 of iron and steel galvanized sheets and of articles which were formed or stamped from iron or steel black plates or black sheets and galvanized after the completion of the forming or stamping process amounted to about 1,961,080,107 lbs. The total production of galvanized sheets alone amounted to 1,811,752,565 lbs., while the production of articles formed or stamped from iron or steel black plates or black sheets and galvanized after the completion of the forming or stamping process amounted to about 149,327,542 lbs.

There were 92 plants which made iron or steel galvanized sheets or which stamped or formed articles from iron or steel black plates or black sheets and galvanized them after completing the forming or stamping process. Six of these were located in Massachusetts, 1 in Rhode Island, 2 in Connecticut, 7 in New York, 5 in New Jersey, 9 in Pennsylvania, 1 in Delaware, 3 in West Virginia, 2 in Kentucky, 2 in Georgia, 29 in Ohio, 4 in Indiana, 6 in Illinois, 4 in Michigan, 4 in Wisconsin, 4 in Missouri, and 3 in Iowa.

There were 61 plants in 1913 which manufactured or stamped black plates or black sheets into various forms, and galvanized these forms after the completion of the forming or stamping process. Six of these plants were located in Massachusetts, 1 in Rhode Island, 2 in Connecticut, 6 in New York, 5 in New Jersey, 6 in Pennsylvania, 2 in West Virginia, 2 in Georgia, 10 in Ohio, 1 in Indiana, 5 in Illinois, 4 in Michigan, 4 in Wisconsin, 4 in Missouri and 3 in Iowa.

**Cast-Iron Pipe and Fittings.**

The production in the United States in 1913 of cast iron gas and water, soil and plumbers' pipe and fittings amounted to 1,266,245 net tons, of which 1,002,289 tons were gas and water pipe and fittings and 263,956 tons soil and plumbers' pipe and fittings. The production of gas and water pipe includes 46,831 tons of fittings, while the production of soil and plumbers' pipe includes 68,925 tons of fittings and 7,727 tons of culvert pipe. Of the 67 active plants, 1 was located in Massachusetts, 6 in New York, 9 in New Jersey, 9 in Pennsylvania, 1 in Maryland, 3 in Virginia, 1 in Kentucky, 3 in Tennessee, 2 in Georgia, 15 in Alabama, 1 in North Carolina, 9 in Ohio, 1 in Indiana, 3 in Illinois, and 1 each in Michigan, Colorado and Oregon.

Thirty-four plants reported the manufacture of cast iron gas and water pipe and fittings in 1913, of which 1 was located in Massachusetts, 2 in New York, 5 in New Jersey, 5 in Pennsylvania, 1 in Maryland, 3 in Virginia, 1 in Kentucky, 1 in Tennessee, 1 in Georgia, 5 in Alabama, 6 in Ohio, 1 in Michigan, 1 in

Colorado, and 1 in Oregon. Four of the plants made cast iron soil and plumbers' pipe and fittings as well as gas and water pipe. There were 37 plants which made soil or plumbers' pipe or cast-iron culvert pipe in 1913, of which 5 were located in New York, 5 in New Jersey, 4 in Pennsylvania, 1 in Maryland, 2 in Tennessee, 1 in Georgia, 11 in Alabama, 1 in North Carolina, 3 in Ohio, 1 in Indiana, and 3 in Illinois. Four of the plants also made gas and water pipe.

### OPENING FOR EXPORT TO AUSTRALIA.

AN Australian firm writes stating that they have been closely and extensively identified with a general lighting and heating business in gas, electric and oil of all desriptions through the Commonwealth of Australia and New Zealand. Their principal supplies have hitherto been obtained from Germany and Austria, and in view of recent events, the directors have decided in future to confine the operations of the company to goods manufactured in the Empire. They are therefore desirous of immediately getting in touch with manufacturers in the above lines. In addition to the above they state that they are already identified with the general hardware trade and are open to negotiations for agencies of special lines contingent to that business especially from manufacturers of engineering and similar lines. It is suggested that any firms who communicate should send full catalogues with complete export price lists and details of what is offered.

It is probable that one of the directors of the firm will next year visit the Panama Exposition and at the same time take a tour through Canada which would give the opportunity of personally interviewing firms with whom communication has occurred. They consider the present time an excellent opportunity for Canadian manufacturers in Australia. Canadian firms desiring business of this character are asked to communicate with D. H. Ross, Canadian Trade Commissioner, Stock Exchange Buildings, Melbourne, and meantime they can obtain the address of the firm named on application to the Department of Trade and Commerce, Ottawa.

**Kate Gleason,** secretary-treasurer of the Gleason Works, Rochester, N.Y., has won the distinction of being the first woman admitted to the membership of the American Society of Mechanical Engineers. Miss Gleason took a mechanical engineering course in Cornell University and received practical training at the plant of her father, William Gleason, in building, estimating and selling machinery. At present she is reorganizing the Ingle Machine Co. Her specialty is designing gearing and estimating on same.

## Canadian Commercial Intelligence Service

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

### CANADIAN TRADE COMMISSIONERS

**Argentine Republic.**

H. R. Poussette, 278 Balcarce, Buenos Aires. Cable Address, Canadian.

**Australasia.**

D. H. Ross, Stock Exchange Building, Melbourne, Cable address, Cancoma.

**British West Indies.**

E. H. S. Flood, Bridgetown, Barbados, agent also for the Bermudas and British Guiana. Cable address, Canadian.

**China.**

J. W. Ross, 6 Kiukiang Road, Shanghai. Cable Address Cancoma.

**Cuba.**

Acting Trade Commissioner, Lonja del Comercio, Apartado 1290, Havana. Cable address, Cantracom.

**France.**

Phillipe Roy, Commissioner General, 17 and 19 Boulevard des Capucines, Paris. Cable address, Stadacona.

**Japan.**

G. B. Johnson, P.O. Box 109, Yokohama. Cable Address, Canadian.

**Holland.**

J. T. Lithgow, Zuidblaak, 26, Rotterdam. Cable address, Watermill.

**Newfoundland.**

W. B. Nicholson, Bank of Montreal Building, Water Street, St. John's. Cable address, Canadian.

**New Zealand.**

W. A. Beddoe, Union Buildings, Customs Street, Auckland. Cable address, Canadian.

**South Africa.**

W. J. Egan, Norwich Union Buildings, Cape Town. Cable address, Cantracom.

**United Kingdom.**

E. de B. Arnaud, Sun Building, Clare Street, Bristol. Cable address, Canadian.

J. E. Ray, Central House, Birmingham. Cable address, Canadian.

Acting Trade Commissioner, North British Building, East Parade, Leeds. Cable address, Canadian.

F. A. C. Bickerdike, Canada Chambers, 36 Spring Gardens, Manchester. Cable address, Cantracom.

Fred. Dane, 87 Union Street, Glasgow, Scotland. Cable address, Canacom.

Harrison Watson, 72 Basinghall Street, London, E.C., England. Cable address, Sleighing, London.

### CANADIAN COMMERCIAL AGENTS.

**British West Indies.**

Edgar Tripp, Port of Spain, Trinidad. Cable address, Canadian.

R. H. Curry, Nassau, Bahamas.

**Colombia.**

A. E. Beckwith, c-o Tracey Hmos, Medellin, Colombia. Cables to Marmato, Colombia. Cable address, Canadian.

**Norway and Denmark.**

C. E. Sontum, Grubbeged No. 4, Christiana, Norway. Cable address, Sontums.

**South Africa.**

D. M. McKibbin, Parker, Wood & Co., Buildings, P.O. Box 559, Johannesburg.

E. J. Wilkinson, Durban, 41 St. Andrew's Buildings, Durban, Natal.

### CANADIAN HIGH COMMISSIONER'S OFFICE.

**United Kingdom.**

W. L. Griffith, Secretary, 17 Victoria Street, London, S.W., England.

# INDUSTRIAL AND CONSTRUCTION NEWS

**Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.**

## Engineering

**St. Catharines, Ont.**—The Reo Motor Car Co. has received an order for shrapnel shells.

**Transcona, Man.**—It is announced that the G. T. P. are working a large order for shells at the shops here.

**Craik, Sask.**—G. Carlson has submitted a proposition to the council for installing an electric lighting plant.

**St. Mary's, Ont.**—The council are considering the purchase of a gasoline engine and a pump with a capacity of 880 gallons per minute.

**Montreal, Que.**—It is reported that President N. Curry, of the Canadian Car & Foundry Co., has secured some large contracts for war material from the British Government.

**The Holden-Morgan Co.**, Toronto, have moved into larger premises at 579 to 585 Richmond street west, and are installing additional equipment in order to meet all the demand along the lines of special machine work.

**Cobalt, Ont.**—Fire starting shortly after five o'clock last Thursday in the boiler house of the Meteor Mine, which adjoins the McKinley Darragh Savage property, completely destroyed the power plant of the mine, besides the mine blacksmith shop.

**Kingston, Ont.**—The district around the village of Parham on the C. P. R. will secure electrical power. Frame Bros., who own a lumber mill using fifty horse-power supplied by water from a 28-foot fall on Eagle Creek, are having an expert from Toronto look over their property.

**Fredericton, N.B.**—The New Brunswick Department of Agriculture has purchased the first pulverizing plant for grinding lime rock for use as fertilizer that has been brought into Canada. Hon. James A. Murray, Minister of Agriculture, announced that the order for the plant had been placed with a manufacturer in the United States, the cost being approximately $2,000.

**Vancouver, B.C.**—In consideration of the City of North Vancouver granting the company free water and exemption from taxation for a period of ten years, the Dominion Shipbuilding, Engineering and Drydock Co., which has already progressed considerably with its new works beyond Moodyville, is prepared to guarantee the employment during the first year of 250 men, during the second year 300 men, and during the third year 400 men.

**Cobalt, Ont**—The actual construction of the Tough Oakes mill is now almost complete, and nearly all the heavy machinery is on the ground and in place. The mill is scheduled to be running at the end of March, and the construction is fully two-weeks ahead of expectations. As the flow-sheet of the mill is necessarily somewhat different from that of any other in the north country, it is difficult to estimate its capacity, but it will probably be able to treat 150 tons a day.

**Montreal, Que.**—It is understood that the annual meeting of the Hollinger Company will be held here about February 2. About that time the company will have eighty stamps in operation, or twice the number at the same time a year ago. A further twenty stamps will be delivered in the course of next month. These latter will be for the Acme property. A new electric hoist has been ordered for the Hollinger, where a larger tonnage will be drawn for the mill once the eighty stamps are crushing to their capacity. In due course the one hundred stamps will crush 30,000 tons of ore in each four weekly periods, representing a gold content of about $375,000, or nearly $5,000,000 yearly.

**Calgary, Alta.**—C. H. Mitchell, consulting engineer, of Toronto, has reported that it is economically feasible to so regulate the flow of the Bow River, by means of storage works in its upper waters, as to warrant the development at six power sites of over 45,000 continuous 24-hour w.h.p., all within 50 miles of the City of Calgary. Calgary Power Co. has two developments on that river, one at Horse Shoe Falls and the other at the Kananaskis Falls, a little further up stream. The company claims to be able to deliver 26,000 continuous horse-power for nine or ten months in the year and 12,000 horse-power when the river is at its minimum flow. According, however, to the report issued by the Department of the Interior, the Bow River has a capacity of 45,000 continuous 24-hour w.h.p.

## Electrical

**Mount Forest, Ont.**—The hydro-electric by-law was carried here by a substantial majority.

**Durham, Ont.**—The hydro-electric by-law was carried. This town will be on the Eugenia Falls system.

**Shelburne, Ont.**—The ratepayers voted in favor of a distribution system for hydro-electric power to cost $15,000.

**Dundalk, Ont.**—The ratepayers carried a by-law recently to spend $5,000 on a sub-station and equipment for hydro-electric power.

**Kingston, Ont.**—Sir Adam Beck will again be notified by the Kingston Utilities Commission that Kingston is waiting for cheap power. This was decided upon when the commission held its first meeting of the year last Monday.

**Wallaceburg, Ont.**—The Canadian Westinghouse Co. is at present installing equipment in the sub-station on King Street. Later on the transformers will be installed and hydro current will be ready for use probably early next month.

**Newmarket, Ont.**—With hydro power beaten, the Fire and Light Committee of the Town Council have submitted a bill to the Council for a by-law to be submitted to the electorate authorizing the expenditure of $15,000 on poles, wire, and equipment.

**Weston, Ont.**—The town hydro rates were slightly reduced at the meeting of the Weston Water, Power, and Light Commission on January 13, when a new schedule was submitted by W. W. Pope, secretary of the Ontario Commission, and was accepted. The reduction is from 4 cents to 3 cents per 100 square feet of floor space. The minimum floor space charge is 1,000 square feet and the maximum is 3,000.

**Montreal, Que.**—There is a possibility that June next will see St. Catherine Street, from Atwater to Papineau Avenue and Bleury Street from Craig to Sherbrooke, illuminated with the new lamps served by underground cables for which citizens have so long waited. The conduits have been in place for over a year, and the Montreal Public Service Corporation and the Montreal Light, Heat and Power Co. are well advanced with the new underground connections necessary.

# General Industrial

**Montreal, Que.**—The St. Lawrence Tanning Co. are contemplating building a new tannery.

**Brantford, Ont.**—The Brantford Scale Co. will build a factory at a cost of $20,000. J. L. Howard is the manager.

**Montreal, Que.**—The Canada Bread Co. are building an extension to their bakery. Machinery will be required.

**Hamilton, Ont.**—Fire did damage to the extent of $1,000 to the Judd Soap Works, 101 Bay Street, on January 11.

**MacLeod, Alta.**—The MacLean Flour Mills were recently destroyed by fire. The loss is estimated at $30,000, part of which is covered by insurance. The mill may be rebuilt.

**Fort William, Ont.**—The Ogilvie Flour Mills Co., will build an addition to their elevator which will increase the storage capacity by 750,000 bushels, making a total of two million bushes.

**Moose Jaw, Sask.**—Negotiations are proceeding for the reorganization of the Moose Jaw Flour Mills, Ltd., and a prospectus for the benefit of intending shareholders will be issued in a few days.

**Vancouver, B.C.**—The Laminated Materials Co., with head offices in Boston, Mass., has leased the building on the Fraser River owned by the Dominion Match Co., and their machines are on the way to Vancouver.

**Chambly, Que.**—The Chambly Manufacturers, Ltd., makers of leather goods, have started operations at their new plant at Chambly, Canton. The company has a capital of $100,000, and the building, which is 200 x 100 feet and three storeys high, cost $50,000.

**Moose Jaw, Sask.**—Dr. Jackson, the inventor of "Roman" meal, has, as a result of his visit to Moose Jaw, placed this city upon his list of suitable places wherein to locate a mill for the manufacture of the meal. Already the doctor has mills running in Tacoma, Duluth, St. Louis, Toronto.

**Beamsville, Ont.**—Messrs. Frampton & Stewart waited upon the council on Jan. 11 with reference to the erection of a jam factory. Mr. Stewart said that the company would like a loan of $10,000, for which they would pay interest, a fixed assessment, and help in securing a good site at a nominal cost. They would also want a supply of water.

**Raymond, Alta.**—A telegram from Jesse Knight, president of the Knight Sugar Co., received on January 14, by Raymond Knight, stated that the directors of the company at a meeting in Salt Lake had definitely decided to move the factory from Raymond to Layton, Utah. There is only one way now to hold the sugar industry in Alberta, that is to buy the plant with Canadian capital. Such a scheme will likely be launched immediately.

# Municipal

**Toronto, Ont.**—The township of Lambton Park are proposing to install a waterworks system.

**Calgary, Alta.**—Extensions to the fire alarm system have been recommended by Fire Chief Smart.

**Calgary, Alta.**—Extensions to the gas pipe line are contemplated. City Engineer Craig has the work in hand.

**Guelph, Ont.**—The tenders for improvements to the gas plant have been opened and considered, but no award has yet been made.

**Vancouver, B.C.**—The municipality of South Vancouver contemplate installing a new 12-in. water main, also valves and hydrants.

**Ottawa, Ont.**—The Board of Control has ordered two fire engines from the American La France Co. The price for the two engines is $22,275.

**Little Current, Ont.**—A by-law will be voted on by the ratepayers on Jan. 25 to authorize raising $8,000 for completing the electric light plant.

**Halifax, N.S.**—The City Council have under consideration the formation of a factory district along the lines suggested by the City Improvement League some years ago.

**Humboldt, Sask.**—The ratepayers will vote on a by-law on January 26 to sanction the expenditure of $3,164 on completing the construction of the electric light system.

**Brantford, Ont.**—Chipman & Power, consulting engineers of Toronto, have the work in hand for the proposed extensions to the waterworks system, for which a by-law was recently passed.

# Tenders

**Calgary, Alta.**—Tenders will be received up to February 12, 1915, for the furnishing and erecting of steel superstructure for Louise Bridge at 9th St. West. Plans, specifications and information may be obtained from the city engineer's office, upon making a deposit of $5.

**Toronto, Ont.**—Tenders will be received at this department until Monday, February 1, 1915, for the electric fixtures required for new Government House, Rosedale, Toronto. Plans and specifications can be seen at this department. H. F. MacNaughten, secretary, Public Works Department.

**Toronto, Ont.**—Tenders will be received by the chairman of the Board of Control, City Hall, up to Tuesday, February 2, 1915, for the supply of cast iron special castings. Specifications and tender form for the foregoing may be obtained upon application at Room 12, purchasing and accounting section, of the Department of Works, City Hall.

**Torotno, Ont.**—Tenders will be received up to Tuesday, February 2, 1915, for the supply and delivery to the Street Cleaning Department of 100 (more or less) loose paper can receptacles, as may be required. Specifications may be seen and form of tender obtained, together with all information relative thereto, at the office of the Street Cleaning Department, City Hall, Toronto.

**Toronto, Ont.**—Tenders will be received by the chairman of the Board of Control, up to Tuesday, February 16, 1915, for supply and installation of furnaces and appurtenances for refuse incinerating plant. Specifications and tender form for the foregoing may be obtained upon application at the office of the Street Commissioner, Department of Street Cleaning, City Hall, Toronto.

# Railways—Bridges

**Transcona, Manitoba.**—A meeting of Transcona property owners was held recently in the office of Moore & Sutherland, barristers, Winnipeg. The object of the gathering was to secure encouragement for the location of shops at Transcona for the Hudson Bay Railway.

**Vancouver, B.C.**—With the laying down of about forty miles of steel in the neighborhood of Ashcroft, B.C., the C. N. R. will link up with the Pacific Coast, and to follow the opening of the Panama Canal, business people of the East look for a large development in trade generally.

**Ottawa, Ont.**—The Entwistle and Alberta Southern Railway Co., is applying to Parliament for incorporation to build from Entwistle on the G. T. P., 55 miles south to the Saskatchewan River. The Southern Central Pacific Railway Co. is asking for an extension of time to build its railway from Vancouver to Hudson Bay.

# New Incorporations

**The Regina Mining Co.** has increased the capital stock from $50,000 to $200,000.

**The American Madoc Mining Co.**, incorporated under the laws of New Jersey, has been authorized to carry on business in the Province of Ontario with a capital not exceeding $200,000.

**Vitrified Clays, Ltd.**, incorporated in Alberta, has been authorized to conduct business in Ontario with a capital not to exceed $40,000. Frank B. Goodman, of Toronto, has been appointed attorney.

**H. & H. Box Co.** has been incorporated at Toronto, Ont., with a capital of $100,000 to manufacture boxes, etc., at Pembroke, Ont. Incorporators: A. J. Thomson, W. Symon Morlock and A. Latimer, all of Toronto, Ont.

**The Ideal Incinerator and Contracting Co.** has been incorporated at Toronto, with a capital of $100,000, to manufacture crematories, furnaces and incinerators at Toronto. Incorporators—J. T. White, George R. Sproat and Franklin M. Metcalfe, all of Toronto.

**The Hall Furniture Co** has been incorporated at Ottawa, Ont., with a capital of $125,000 to manufacture chairs and furniture of all kinds at Hanover, Ont. Incorporators: R. J. Ball, John Ball and M. L. Ball, all of Hanover, Ont.

**Automatic Paper Box Co.** has been incorporated at Ottawa, Ont., with a capital of $100,000 to manufacture boxes and other similar receptacles, at Toronto, Ont. Incorporators: H. H. Hawkins, W. Lanskaill and C. E. Lanskaill, all of Toronto, Ont.

**G. M. Gest, Ltd**, has been incorporated at Ottawa, Ont., with a capital of $100,000 to carry on business as electrical and mechanical contractors at Montreal, Que. Incorporators: W. R. L. Shanks, F. G. Bush and G. R. Drennan, all of Montreal, Que.

**The Gulf Pulp & Lumber Co.** has been incorporated at Ottawa, Ont., with a capital of $250,000 to manufacture wood and pulp at Montreal, Que. Incorporators: S. Frankland Kavanaugh, V. R. Lamontagne and F. W. Harper, all of Montreal, Que.

**Manufacturing and Contracting Co. of Canada, Ltd.**, has been incorporated at Ottawa, Ont., with a capital of $150,000 to carry on a construction business at Toronto, Ont. Incorporators: T. A. Rowan, J. E. Jones and N. Sommerville, all of Toronto, Ont.

**Munro Construction Co.** has been incorporated at Ottawa, Ont., with a capital of $50,000, to carry on business as general contractors, builders and engineers at Montreal, Que. Incorporators: T. J. Coulter, W. S. Jones and R. T. Nulin, all of Montreal, Que.

# Trade Gossip

**The Standard Chemical Iron and Lumber Co., of Canada, Ltd.**, is reducing its capital stock from $6,000,000 to $5,000,000.

**The Norton Grinding Co.**, Worcester, Mass., have sold in Canada during the last few months twenty machines for grinding shrapnel shells.

**The Nova Scotia Steel & Coal Co.**, New Glasgow, has placed an order in the United States for a complete equipment for making shrapnel shells.

**The Fisher Motor Co., Ltd.**, have received an order from the Dominion Government for the manufacture of 20,000 shrapnel shells. These will be made at the Orillia factory.

**The Ontario Power Co.**, of Niagara Falls, Ont., have given notice of a proposal to increase the capital stock from $10,000,000 to $15,000,000. A meeting will be held on Feb. 16.

**A. F. Yarrow** recently gave the 2,500 employees of Yarrow & Co., Scotstoun, on the Clyde, Scotland, a new ten-shilling note ($2.50) each as a gift in recognition of the energy displayed in the completion of several vessels.

**Thos. Firth & Sons, Ltd., Sheffield,** are supplying large quantities of bullet-proof sheets of a special alloy steel for use on aircraft, armoured motors and other purposes to the Allied armies. The sheets have proved highly effective.

**Sherbrooke, Que.**—It is probable that the exportation of asbestos will be resumed on a larger scale than previous to the war. It is reported that several concerns in Australia have placed contracts for large quantities of asbestos from the Thetford Mines district.

**The Algoma Steel Co.** has taken orders for 17,700 tons of rails in the United States: 8,000 for the Pere Marquette, 6,000 for the Grand Trunk Railway for Michigan delivery, 1,700 for the Big Four, and 2,000 for the New York Central. All were sold at about $25.50 at mill.

**Montreal, Que.**—The new officers of the Board of Trade, who will be installed at the annual meeting, to be held on the afternoon of Tuesday, January 26th, are as follows:—President, George F. Benson; first vice-president, H. B. Walker; second vice-president, Zephirin Hebert; treasurer, Anson McKim.

**The National Boiler Washing Co.** of Montreal have opened an office at 1206 Union Trust Building, Winnipeg, Man., with T. W. Purcell in charge. F. H. Hopkins & Co. are at the same address.

**Sydney, N.S.**—The Broughton coal mine, owned by the Cape Breton Coal, Iron and Railway Co., which has been in operation for over a year, closed down on January 18 for an indefinite period. Manager C. J. Gall stated that this action has been made necessary owing to the financial situation due to the war.

**Shell Manufacture.**—Representatives of various manufacturing companies are in Ottawa this week conferring with the Government in connection with the construction of shells. These companies, the demand for whose normal output has been seriously interfered with by the war, are anxious to take advantage of a demand which promises to be fairly brisk for some time to come and to manufacture a product which can be profitably disposed of. Already a large number of manufacturing firms have put in the plant necessary for such manufacture, and it is estimated that the total output of Canadian shells will soon approximate 100,000 per day. It is expected that this will shortly be increased until 200,000 per day are being turned out for the cannon of the allies.

**Cobalt Tonnage Declines.**—While December was far below the previous December in tonnage of Cobalt ore shipped, it was considerably higher than the previous month. Silver is absorbed in London, no one quite knows how or for whom as little goes to China, and the demand in India is spasmodic. In the arts there is little or no demand, but the price remains steadily at about 50 cents. The Mining Corporation of Canada, from its three mines, the Townsite, the Cobalt Lake and the City of Cobalt, was by far the heaviest shipper, the McKinley Darragh figuring next on the list. There was a small consignment to the Cobalt sampling plant from an Elk Lake prospect, the first from that camp for many months. The Beaver and Timiskaming group, upon which the rich find has recently been made, showed much greater activity.

**Australian Tariff Increase.**—Details of the new Australian Customs tariff adopted by the Commonwealth Parliament last month have been received by the Department of Trade and Commerce, Ottawa. There has been a pretty general stiffening of the protective and revenue-producing

features of the old tariff, and a considerable trade in Canadian exports of agricultural implements, printing paper, lumber, fish in tins, motor cars and vehicle parts will be adversely affected. The Commonwealth has increased the preference to the United Kingdom on manufactured goods from 5 per cent. to 10 per cent., but this increase has been made in the main by simply raising the 5 per cent. on the general tariff upon goods imported from all other countries. Prior to the last general elections in Australia the Government promised increased protection to Australian interests, and the new tariff fulfills this pledge.

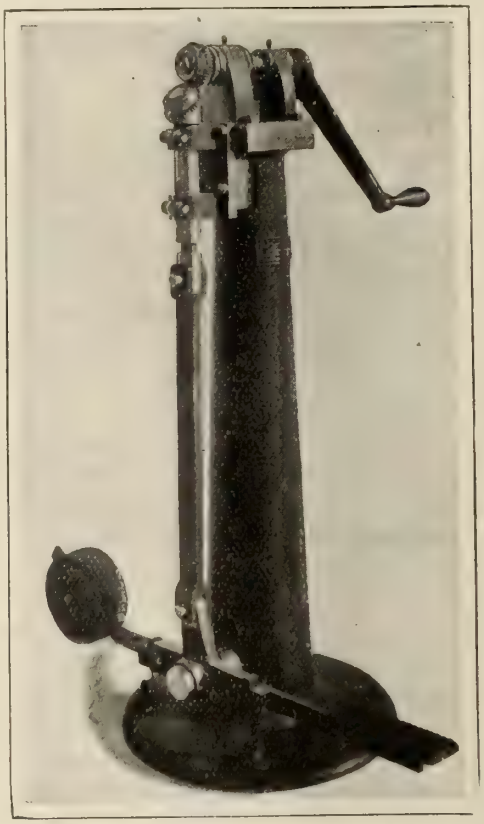
### MACHINE FOR MARKING FUSE CAPS.

A SPECIAL marking machine for graduating and numbering bevel fuse caps in one operation, and fully equipped with graduating dies ready for the operator to start work, has just been put on the market by the Noble & Westbrook Mfg. Co. of Hartford, Conn. This is an addition to the company's well-known Dwight slate marker. The machine illustrated herewith is simple in construction, accurate and easy to operate, which means quite a saving when a large quantity of pieces are to be graduated, especially at this juncture, with war orders large and pressing.

The graduating die is held in a holder keyed to shaft, which as mark is made, revolves with the die, at the same time winding a spring tension which, as soon as contact with work is broken, returns work holder to its proper position to mark the next piece. The shaft runs in bronze bearings with collar adjustment, and the work is held in place relative to die by accurately cut gears. Depth of impression is provided by foot pressure through a lever and cam, which is adjustable so that it is possible to regulate the depth of impression to an hundredth part of an inch. This means that even and accurate impressions can be secured.

The machine is suitable to graduate not only fuse caps, but any bevel surface, such as micrometer collars on lathes, milling or any machine that uses these graduated collars. It can also be used to put on lettering in place of graduations on bevel surfaces, and will give excellent results. The saving of time and labor in graduating or lettering is a feature, as with one turn of the hand lever a complete mark is made and all such can be depended upon for uniformity and accuracy.

A number of these machines have already been supplied to Canadian manufacturers in connection with shrapnel shell orders now being filled. All shrapnel shells must bear the maker's name, date of manufacture, size, etc., on the side, and these impressions are made at one operation by the regular type ma-



FUSE CAP MARKING MACHINE.

chine. The special fuse cap marking machine is for graduating the caps to determine the exact distance for throwing and exploding the shell, etc.

## Catalogues

**J. W. Paxson Co.**, Philadelphia, Pa., are distributing a calendar for 1915, printed in bold type and featuring principally the "Albany" molding sand.

**The Vulcanite Portland Cement Co.**, Philadelphia, Pa., has published in pamphlet form a reprint of the paper entitled, "Proportioning Aggregates for Portland Cement Concrete," by Albert Moyer. The paper was read before American Society for Testing Materials, the proper proportioning of materials in concrete.

**Factory Appliances.**—The Cleveland Wire Spring Co., Cleveland, Ohio, have sent us a copy of catalogue No. 28, describing their line of steel shop boxes, steel barrels, waste cans, steel racks, and various other steel and wire specialties of factory equipment. Each line is illustrated and accompanied by particulars and sizes. An interesting feature is that entitled "Things Your Factory Needs."

**American Pulleys.**—The American Pulley Co., Philadelphia, Pa., have issued a series of data sheets, held together in an attractive green binder. Each data sheet deals with some distinctive feature concerning the "American" pressed split pulleys, including results of comparative tests with diagrams and charts. A number of loose leaflets dealing with these pulleys are mailed with the data sheets.

**Hydraulic Presses**, made by the Mesta Machine Co., Pittsburg, Pa., are described in a bulletin recently issued. These presses are of the quick-acting steam-hydraulic type, and are designed for such operations as forging, flanging, punching and bending. The chief features of this type of press are dealt with fully, and the illustrations show a number of high capacity presses in operation.

**Valves.**—The Lunkenheimer Co., Cincinnati, O., is distributing the "Ferrenewo" and "Clip" valves. The former is a globe valve and the latter a gate valve. Both types are described at length, and the special features of their design are dealt with in detail. Price list and tables of leading dimensions are included, covering each size. The illustrations showing the construction of these valves are reproduced in attractive colors.

**Transmission of Power by Ropes** is the title of a paper read by Edwin Kenyon, of Dukinfield, near Manchester, England, before the National Association of Cotton Manufacturers at Boston, Mass. This paper, while not of particularly recent date, is none the less interesting, and contains much valuable data on the subject of rope drives. The paper deals entirely with English practice, and many interesting drives in Old Country factories and mills are illustrated. The paper contains considerable information on pulley grooves, ropes and splices, and is fully illustrated. Further information can be obtained from Jones & Glassco., engineers, Montreal, Que.

## Book Reviews

**Germany's Naval Pocket Book for 1915**, just published, shows obvious signs of having been heavily "censored," for copies received deal only with the fleets of enemies and those of neutral powers, and say nothing of the German fleet. Not a single word is said as to the German losses, new, building, or old ships ,while all the books of other years included a

complete list, with all particulars of the German navy.

**Installing Efficiency Methods**, by C. E. Knoeppel; 258 pages, 10 in. by 7 in., 103 charts and diagrams; published by the Engineering Magazine, New York. Price, $3. This book is an addition to the Works Management Library, and the contents, as originally prepared, appeared in a series of articles published in the Engineering Magazine during the year 1914. In this volume, however, the matter has been much expanded and to a considerable extent recast. For the benefit of those who may have already perused these articles it may be stated that the first five chapters are new, except a list of questions in chapter 5. A chapter on auxiliary devices for the planning department and a supplementary chapter on costs have been added, while a chapter on the efficiency clearing house has been considerably enlarged. More charts and diagrams have also been introduced. In writing this book, the author has endeavored to deal with practice rather than mere definition of principles. He describes what the actual methods are that increase the efficiency of a manufacturing establishment and how they are put into a practical effect. In this respect the book differs from most other publications on the subject. The book contains 19 chapters, including an appendix on manufacturing costs, embracing a skeleton outline of a cost accounting system. The first chapter gives a hypothesis of a company in business difficulties and, in succeeding chapters, the method of procedure for placing it on a satisfactory basis is described. Each phase of the system is dealt with thoroughly and its connection with the general scheme always kept in view. The diagrams and charts, essential in work of this nature, are carefully drawn, and are of great value to a proper understanding of the text. The methods described are essentially applicable to engineering establishments, and, being based on actual practice, will be valuable to those readers interested in efficient organization and management.

143-153 University Ave., Toronto

20 TIMES THE SERVICE
That's what this self-hardening, high-speed steel chaser does for the LANDIS DIE.
Four long cutters tangentially disposed to the work carried in suitable holders make an ideal cutting condition. This, along with its many other distinctive characteristics, has established for us a world-wide reputation.
WRITE FOR CATALOGUE NO. 21.

# EXAMPLE AND COURAGE

We're not living in boom times. Everybody recognizes the seriousness of the situation. We all appreciate the value of courage in times of trial and that the force of example must not be lost sight of. Passive resistance is not good enough in war times. Aggression is a symbol of victory no less renowned in peace than in war.

Be courageous! You are fighting for a principle; for right and progression, not might and destruction. Then Advertise! Advertise! Advertise!

## Start It Running

## Keep It Running

There's no lost motion and no waste time with a Globe Tumbling Barrel. Every minute is economized. You can start it running the first thing in the morning and keep it running until the whistle blows, if necessary, without once having to stop it to inspect the work, fill or empty it.

## GLOBE TUMBLING BARRELS

will give you better tumbling in less time and at less cost than the ordinary barrel. And you can use it for either gentle or violent tumbling by simply changing the angle at which the barrel is running.

Globe Barrels are made in eight stock sizes, list price from $50 to $170. If you want to know how the Globe Barrel will help you, write for Catalogue 2, which tells about its many advantages.

**Morse Twist Drill & Machine Co.**
NEW BEDFORD - MASS., U.S.A.

# 14" Improved Wet Tool Grinder

Modern design and heavy construction, with self-oiling bearings throughout, and equipped with our well-known vertical centrifugal pump, which furnishes a constant supply of water which can be regulated to suit work being done. The propeller of this pump is loosely fitted, and does not touch the case at the nearest point. A sleeve cap prevents leakage without the use of packing

Our 14" Improved Wet Tool Grinder is designed to carry 14" x 1½" wheels, and a Special Rest is furnished, to be used in connection with a Huntington or other wheel dresser of similar design. Also built in 20" and 30" sizes. Can be fitted with a 1 H.P. constant speed motor.

WRITE FOR FULL PARTICULARS AND PRICE.

*A Valuable New Book on an Important Trade*

## PATTERN-MAKING

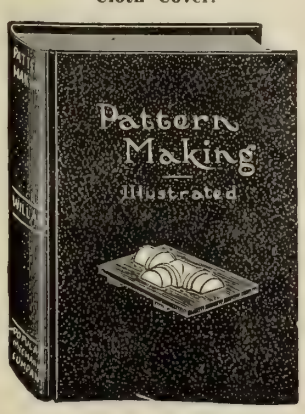
By G. H. WILLARD

**Two Significant Opinions:**

"I think the book is the best I ever saw for the price." Edwin Sluyter, Construction Engineer, Burroughs Adding Machine Co., Detroit.

"I consider this is a valuable book and should be in the hands of all men engaged in this line of business." E. W. Clarke, Wilmington Malleable Iron Co., Wilmington, Delaware.

**224 Pages. 312 Illustrations. Cloth Cover.**



**With Additional Chapters on Core-Making and Molding**

**"WRITTEN SO YOU CAN UNDERSTAND IT."**

A book for the man who does the work. Written by a practical patternmaker of many years' experience. Gets right down to business in the first chapter and keeps it up throughout the book. Full of kinks and actual working information. Profusely illustrated.

**Chapter Headings**

I. Pattern-Making as a Trade. II. The Tools. III. Woods. IV. Joints. V. Turning. VI. Turning (Continued). VII. Turning (Continued). VIII. Turning (Concluded). IX. The Circular Saw. X. The Circular Saw (Continued). XI. Machine Tools. XII. Machine Tools (Continued). XIII. Simple Patterns. XIV. Simple Patterns (Continued). XV. Simple Patterns (Concluded). XVI. Crooked Patterns. XVII. Large Pattern Work. XVIII. Large Pattern Work (Continued). XIX. Crosshead Guide Patterns. XX. Sweep Work. XXI. Pipe Work. XXII. Stove Pattern Work. XXIII. Molding—Machine Work. XXIV. Molding Pattern Work.

**Part II.—Core-Making and Molding.**

Chapter I. Core-Making, Simple and Complex. II. Principles in Molding. III. Loam Patterns and Loam Molds. Everyone following this trade, or intending to learn it, should have a copy of this valuable book.

A THOUSAND wishes alone would not bring you success in 1915. Although we do sincerely wish you all prosperity in the New Year we are prepared and waiting to back up our wishes with a real and tangible service.

If you are a subscriber, let CANADIAN MACHINERY help you in 1915.

If you are a buyer of Machine Tools, consult this directory and the advertising pages.

If you are a manufacturer of Machinery or a Dealer, we can help you to bigger business and a more lasting connection.

Is your name in this directory? If so, there is reasonable expectation that our wishes for your enjoying a prosperous year shall be fulfilled.

# THIS DIRECTORY IS FOR YOUR USE

IF you want the correct 'phone number, you use the official telephone directory. If you wish to definitely ascertain the location of a certain street, you consult a city directory.

If you are in need of equipment of any description, the best way to buy it is to consult our Buyers' Directory. If what you require isn't advertised in this particular issue, write to the firm or firms listed under the title of the machine you require, and catalog or literature will be gladly sent.

The firms listed in this Directory think enough of your business to ask for it, and they have unlimited confidence in the product they advertise.

Consult this Directory and you can't go wrong.

# Are You Satisfied That Your Polishing Methods Cannot Be Made Better?

Polishing is one of the operations that is making rapid strides toward greater efficiency through the use of

## NORTON ALUNDUM GRAIN

Possibly the test which is cited below may have some practical application to your own polishing problems.

A manufacturer of road machinery was polishing 90 point carbon steel mould boards—6 to 18 feet long and 6 to 18 inches wide—by first roughing out with a solid wheel and then finishing with a polishing wheel. The solid emery wheels were replaced by extra soft, compressed canvas polishing wheels, coated with No. 36 T. J. Alundum. For the finishing operation No. 80 T. J. Alundum was substituted for No. 46 emery. By these changes the time for the complete operation was reduced to the time originally required for the roughing out.

*If you are interested, we will gladly demonstrate.*

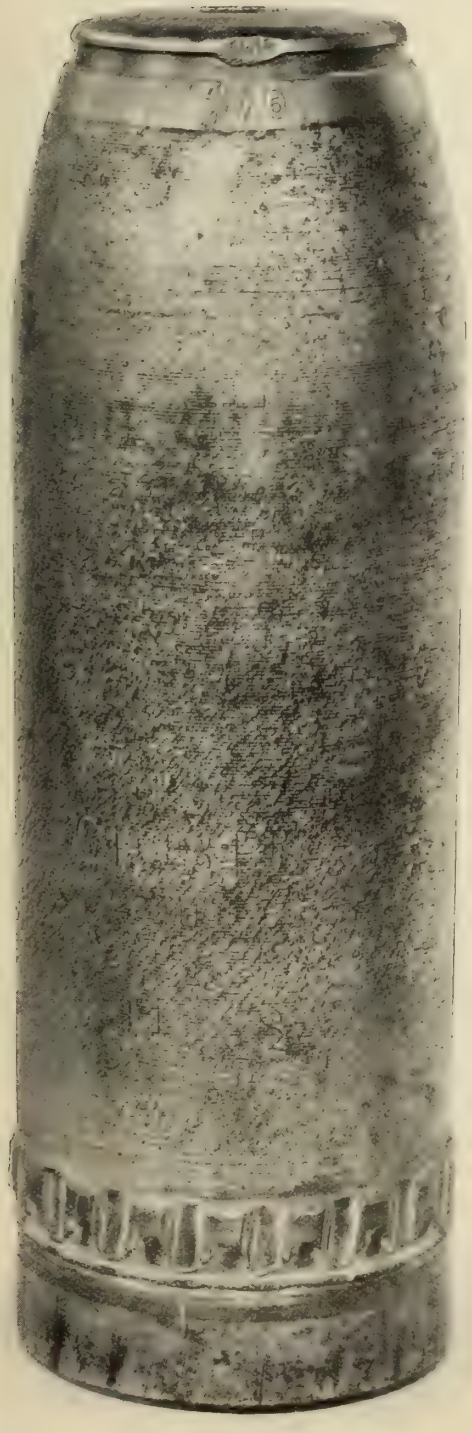
# CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields. Published by the MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg and London, Eng.

Vol. XIII | Publication Office: Toronto, January 28, 1915 | No. 4



## STOOD THE TEST!

Our illustration shows an 18 Pr. Q.F. Shrapnel Shell after it had satisfactorily undergone the "Firing Proof," the final test required before acceptance of a lot of Shells by the War Office.

This Final Test determines whether or not a lot of Shells is serviceable and the passing of all the other tests and gaugings in the process of manufacture stands for nothing, unless the Shell selected for the firing proof stands this **FINAL TEST**.

There is a Final Test for Machine Tools as well as for Shells, and the passing of all the preliminary tests of appearance, weight, price and delivery won't help a line of Machine Tools that can't pass the Final Test—The Test of Time.

# 14" Improved Wet Tool Grinder

Modern design and heavy construction, with self-oiling bearings throughout, and equipped with our well-known vertical centrifugal pump, which furnishes a constant supply of water which can be regulated to suit work being done. The propeller of this pump is loosely fitted, and does not touch the case at the nearest point. A sleeve cap prevents leakage without the use of packing

Our 14" Improved Wet Tool Grinder is designed to carry 14" x 1½" wheels, and a Special Rest is furnished, to be used in connection with a Huntington or other wheel dresser of similar design. Also built in 20" and 30" sizes. Can be fitted with a 1 H.P. constant speed motor.

WRITE FOR FULL PARTICULARS AND PRICE.

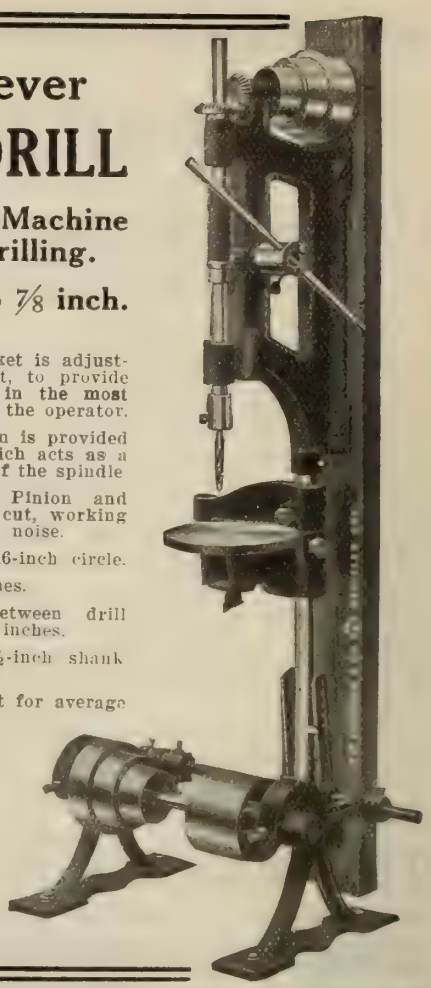
## 16 in. Lever POST DRILL

**A Giant Little Machine For Light Drilling.**

**Will drill up to 7/8 inch.**



The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

Drills to centre of 16-inch circle.

Run of feed 5¼ inches.

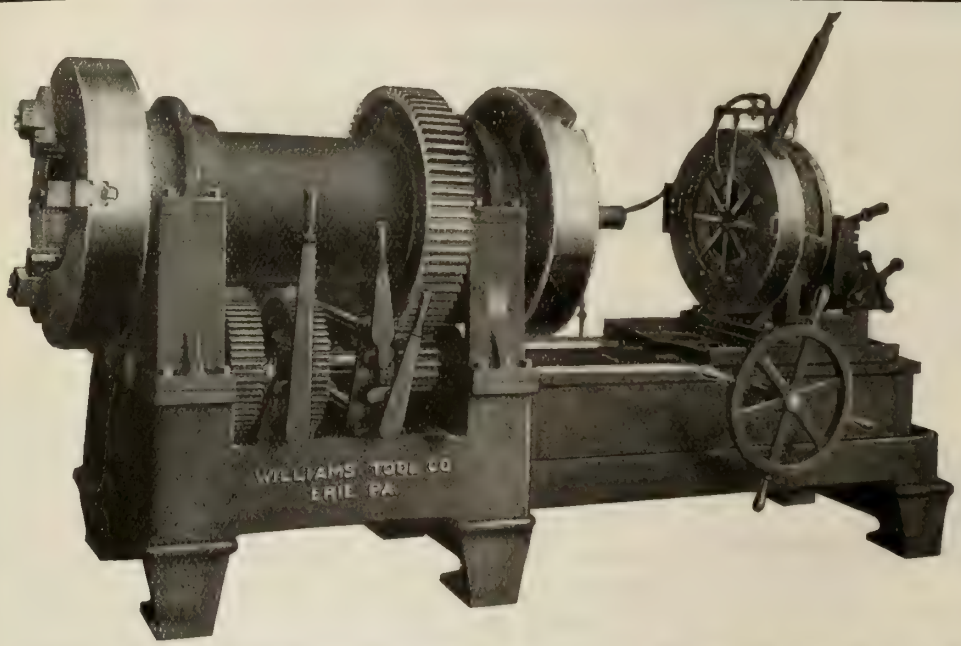
Greatest distance between drill spindle and table, 23 inches.

Spindle bored for ½-inch shank twist drills.

Speed of countershaft for average work, 300 per minute.

**A. B. Jardine & Co.**

**Hespeler, Ontario**



The gas light was a big improvement over the tallow dip, but it had to give way to the electric light; and the Tungsten has superseded the little glimmer that once delighted us.

If you are still employing pipe-cutting methods as antiquated as the tallow dip, you need a Williams Pipe Machine, which occupies the same position in the pipe-cutting field as the Tungsten does in the lighting world, to bring you up-to-date.

*Let us quote you prices and terms: any machine to cut 10 sizes of pipe between 1-4 inch and 18 inch, with any kind of power.*

**Anyone making, selling or buying a pipe machine, claimed to be a Canadian-made Williams Pipe Machine, does so without right or authority from us, and is liable to prosecution for damages.**

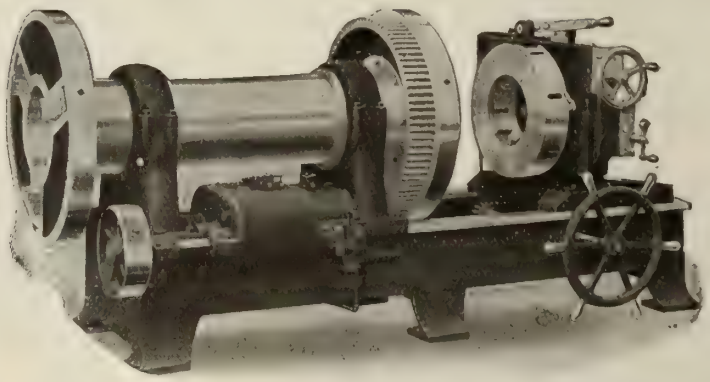
Our Machinery is the best that mechanical ability can produce and does not cost as much as imported machinery.

Write us for catalog and prices on pipe-threading lathes, any capacity, from 1/8 to 18-in., also single and double head rapid nipple machines. No delays, delivery from stock.

## JOHN H. HALL & SONS, LIMITED

### BRANTFORD, CANADA

# BUY THE RIGHT KIND



When deciding on a new machine it is well to bear in mind that a pipe machine receives a great deal of abuse—more, perhaps, than any other machine. A good machine must stand this abuse as well as the use, or soon go to the scrap pile. In addition to the lasting qualities, the extreme simplicity of the machine should be considered. Conveniently located levers will enable the operator to make his changes and adjustments in the shortest possible time.

Let us send you our catalog.

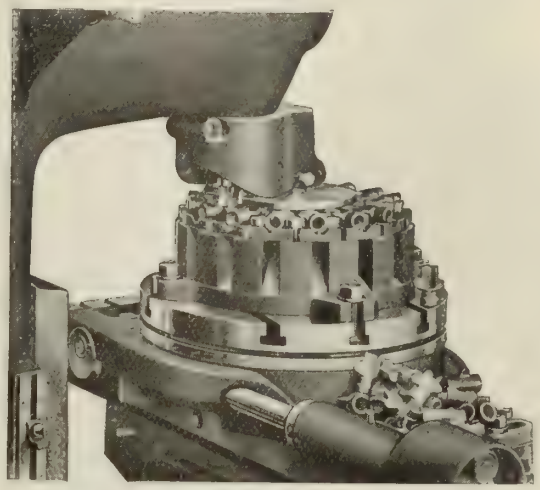
**Canada's Departmental House for Mechanical Goods**

# TRITE, BUT TRUE

A milling machine is most efficient when continuously milling.



A milling operator is most valuable when constantly chucking work

Here's an example where our Service Department combined the two and gave this customer maximum efficiency. The circular jig carrying these gas meter connections continuously passes under the spindle of the No. 2 Vertical Cone. The pieces are automatically clamped and released, the operator handling 10,000 per day.

**If you have pieces that you mill in quantities send us a sample or blueprint. We can make you recommendations that are sure to save you money.**

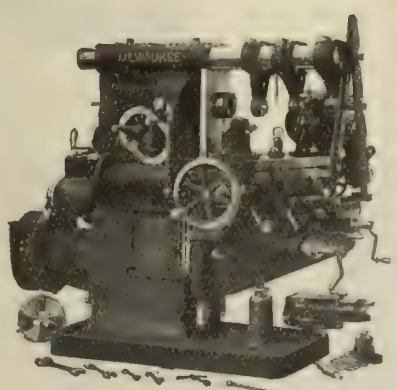
# Milwaukee Millers



## THE DOUBLE OVER ARM

The double over arm is an exclusive feature of Milwaukee Millers. It consists of two steel bars arranged accurately parallel with the spindle, providing for positive alignment of the arbor and preventing it from being pounded out of line. It is impossible for the operator to place the arbor supports on the arbor and double over arm in any other position than exactly in line.

In addition to providing positive alignment of the arbor, the double over arm construction makes it practical to use large diameter cutters at a greater distance from the face of the column, permitting the finishing of a variety of work on Milwaukee Millers that would otherwise have to be taken to a planer.

*Write for a copy of Catalogue No. 19. It illustrates and describes Milwaukee Millers and attachments in detail.*

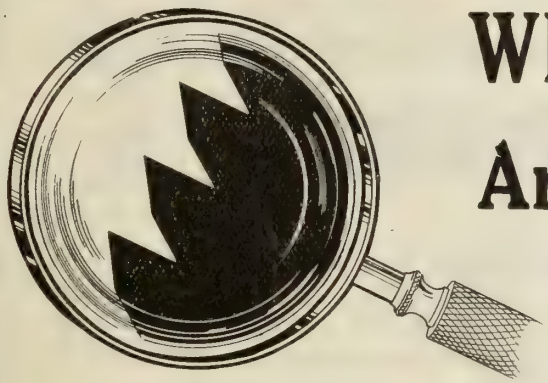
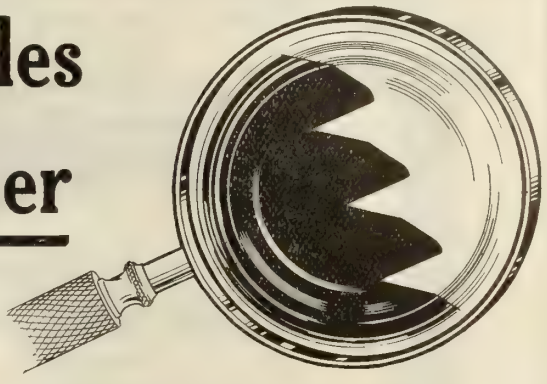
**24 John St., New York City, U.S.A.**

Canadian Distributors :
WILLIAMS AND WILSON, Ltd., MONTREAL.
GENERAL SUPPLY CO. of CANADA, TORONTO.



# Why 2 Files Are Cheaper Than 1



**On the left is a cross-section of a new file, as it appears beneath a magnifying glass. Note the sharp edge of the teeth.**

**On the right is a cross-section of a worn file, magnified. See how the teeth have lost their edge. Obviously, they can't cut as fast and deep and true as when new.**

So that to get the last possible use from an inexpensive file, much costly time and labor is wasted.

A practical test in your shops proves the economy of discarding all files before they're completely worn out. The saving in time, labor and filing cost will show a substantial profit over the extra first-cost of files.

**STYLE H.M.** is a Male Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.

**STYLE O.M.** is an Outside Thread Male Pipe End. Made in sizes ⅜-in. to 1½-in.

**STYLE I.M.** is an Inside Thread Male Pipe End. Made in sizes ¼-in. to 1½-in.

The Male and Female Ends of Bowes Couplings interchange in sizes, ¼-in. to ¾-in. Sizes 1-in. and 1¼-in. interchange. The 1½-in. ends interchange only with themselves.

### BOWES COUPLINGS

Are instantly connected or disconnected.
They are absolutely air-tight under all pressures.
They quickly pay for themselves by stopping costly leaks.
They interchange in sizes most commonly used.
They have no loose parts to be mislaid or lost.
They are made of brass and will not rust.
The U-shaped interchanges in couplings ¼-in. to ¾-in.

### The Cleveland Never Slip Hose Clamp

Made in same sizes as Bowes Couplings

The adjoining cut of Never Slip Hose Clamp shows the "Flanges" which engages the groove provided in all hose ends of Bowes Couplings. The "Model Hose Line" illustrated shows correct styles of couplings to use and proper way to attach the clamps.

### CLEVELAND GROOVED HOSE NIPPLE

**Grooved Nipples** when attached to hose with the wire clamp cannot "blow out," as one-half of the Wire Clamp lies in Nipple Groove, and the other half on the hose, uniting nipple and hose permanently. "Blow outs" are expensive, as one to five men are idle while new connection is being made; time wasted, ten to thirty minutes. Can you afford it?

### WIRE CLAMP TOOL

To apply Wire Clamps to Grooved Hose Nipples you need the Wire Clamp Tool illustrated, a small hand-operated tool at moderate cost which we carry in stock for immediate delivery. In Stock: Riveting and Chipping Hammers, Four-piston Air Drills, Corner Drills, Emery Grinders, Sand Rammers, Holder Ons, Etc.

**WRITE FOR BULLETIN NO. 29.**

IMPORTANT:—The Small Leaks in your "AIR LINE" mean serious loss in DOLLARS. Have you any idea of the amount of "Air" wasted in small leaks at your connections? Air Leakage through 1-16 in. opening equals 5.32 cu. ft. per minute at 80 lbs. It will pay you to install Bowes Couplings and stop costly leaks.

**Write for Catalog No. 12, which illustrates our complete line of Air Tools**

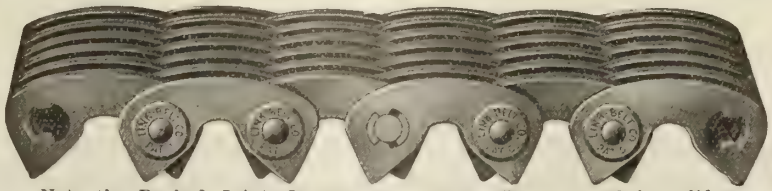
A. R. WILLIAMS MACHINERY CO., TORONTO. WILLIAMS AND WILSON, MONTREAL

# Link-Belt Silent Chain Drives

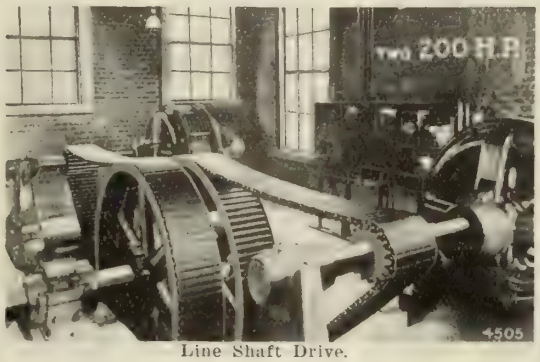


Note the Bushed Joint—It means sustained efficiency and long life.

## Link-Belt Silent Chain Drive is superior to

### Belt Drive because

It cannot slip.
It can be run on short centers.
It can be used in hot, cold or damp places.
It is run slack, and therefore without excessive journal friction.
There is no dangerous sparking.
It transmits power with less loss.



Line Shaft Drive.

### Spur Gear Drive because

It operates quietly.
It can be run at high speed.
Center distance can be arranged to suit convenience of design.
More teeth are in working contact.
Result: smoother action and less wear.
Self-contained bases are not necessary.

# GRIDLEY
# Automatics

**Single and Multiple Spindle**

ARE VERY CONVENIENT. All parts requiring adjustment are readily accessible—especially the tool slide and the tools attached thereto. Operations on the individual bars of stocks are performed simultaneously, and a finished piece is performed every time the tool slide moves forward.

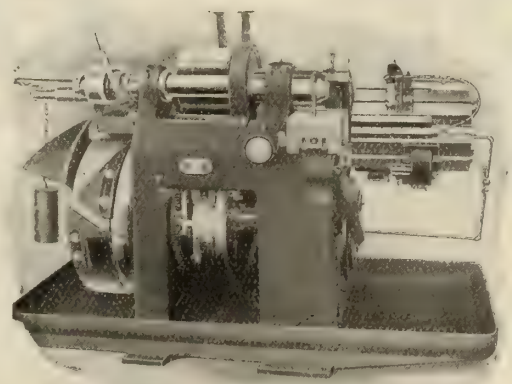
By requiring LESS TIME FOR SET UP FOR CHANGE OF WORK one man can operate from 3 to 6 machines at once, and SAVE YOU MUCH TIME, LABOR AND MONEY.

**Ask Gridley users about "Gridley Economy."** We gladly send their names and addresses.

**Illustrated catalog yours for the asking.**

*Distinctive Features*

**Tool Support.** The tool holder is entirely unlike that of any other automatic turret machine. The **tools are held rigidly without overhang,** and the type of turning tool can be used that makes possible the heaviest cuts and the coarsest feeds. The rigidity between the work and the cutting point is a feature that enables the "Gridley" to do its work **more rapidly** and **more accurately than any other automatic.**



**"GRIDLEY" Single Spindle**

## Vital Factors in Profitable Casting Cleaning

A Good Sand Blast and Cheap Air

# Curtis Sand Blasts

Closed Hopper Sand Blast

Have many features that make them superior.

For instance—Sand screened and Hopper filled at one operation.

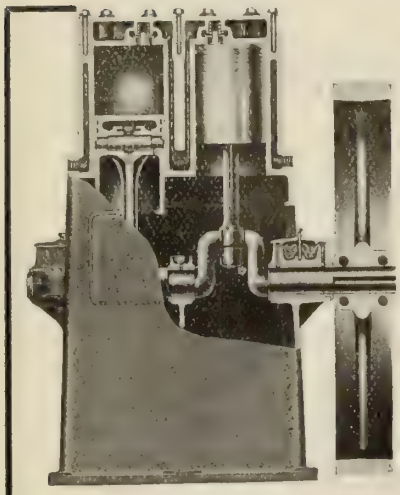
LEVER-OPERATED FILLING VALVE is much faster and handier than the usual screwed-in plug or bolted-on cover valves.

HANDY THROTTLE CONTROL that saves time, air and sand.

WATER SEPARATOR that means fewer chokes due to damp sand.

CHOKE RELIEF VALVE that almost instantaneously relieves a choke when one does occur.

GREATER CUTTING ACTION, due to design that insures less drop in pressure between air line and nozzle.—But why not send for a Curtis Blast on thirty days' free trial?



**CHEAP AIR.**

Service tests prove that CURTIS COMPRESSORS will furnish air at minimum cost for operation and maintenance. They have FEWER PARTS than most compressors and less friction loss. Cylinder heads and valves, as well as cylinder walls, are water jacketed (about 80% more cooling area than double-acting compressors), insuring minimum discharge temperature and less loss of power in pipe line. THE VALVES are lightest of all types—tempered steel discs (1-16 inch in thickness)—they require less attention than any other type.

## Stop Dumping Coal on Your Ash Heap

Tons and tons of the coal you are paying good money for are practically being dumped right on the ash heap—if your boiler contains scale.

And the chances are IT DOES!

Reliable statistics show that 90% of all boilers are scale-infested. Many contain as much as ½ inch.

Look to YOUR boiler. One-eighth inch of scale wastes 1-3 of your power.

This enormous loss should and CAN be eliminated. And the way to do it is to keep your boilers free from scale by means of

## J-M BOILER PRESERVATIVE

No matter what the conditions, this preservative positively removes scale. It works its way through the cracks and practically pries the scale away from the boiler plates.

Mechanical and chemical in action. Made of a harmless vegetable compound. Does not injure boiler. And regularly used prevents future scale formation, pitting, corrosion, etc., thereby lengthening the life of your boiler.

Will not cause foaming or priming. And will not "carry over," therefore can be used in plants where food products come in contact with the steam.

J-M Boiler Preservative is saving thousands of dollars for plants all over the country. It will do the same for you. TRY IT AT OUR RISK.

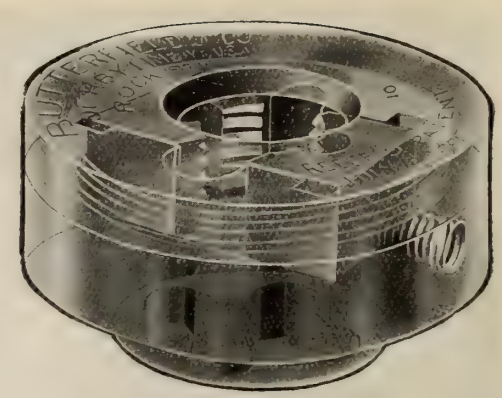
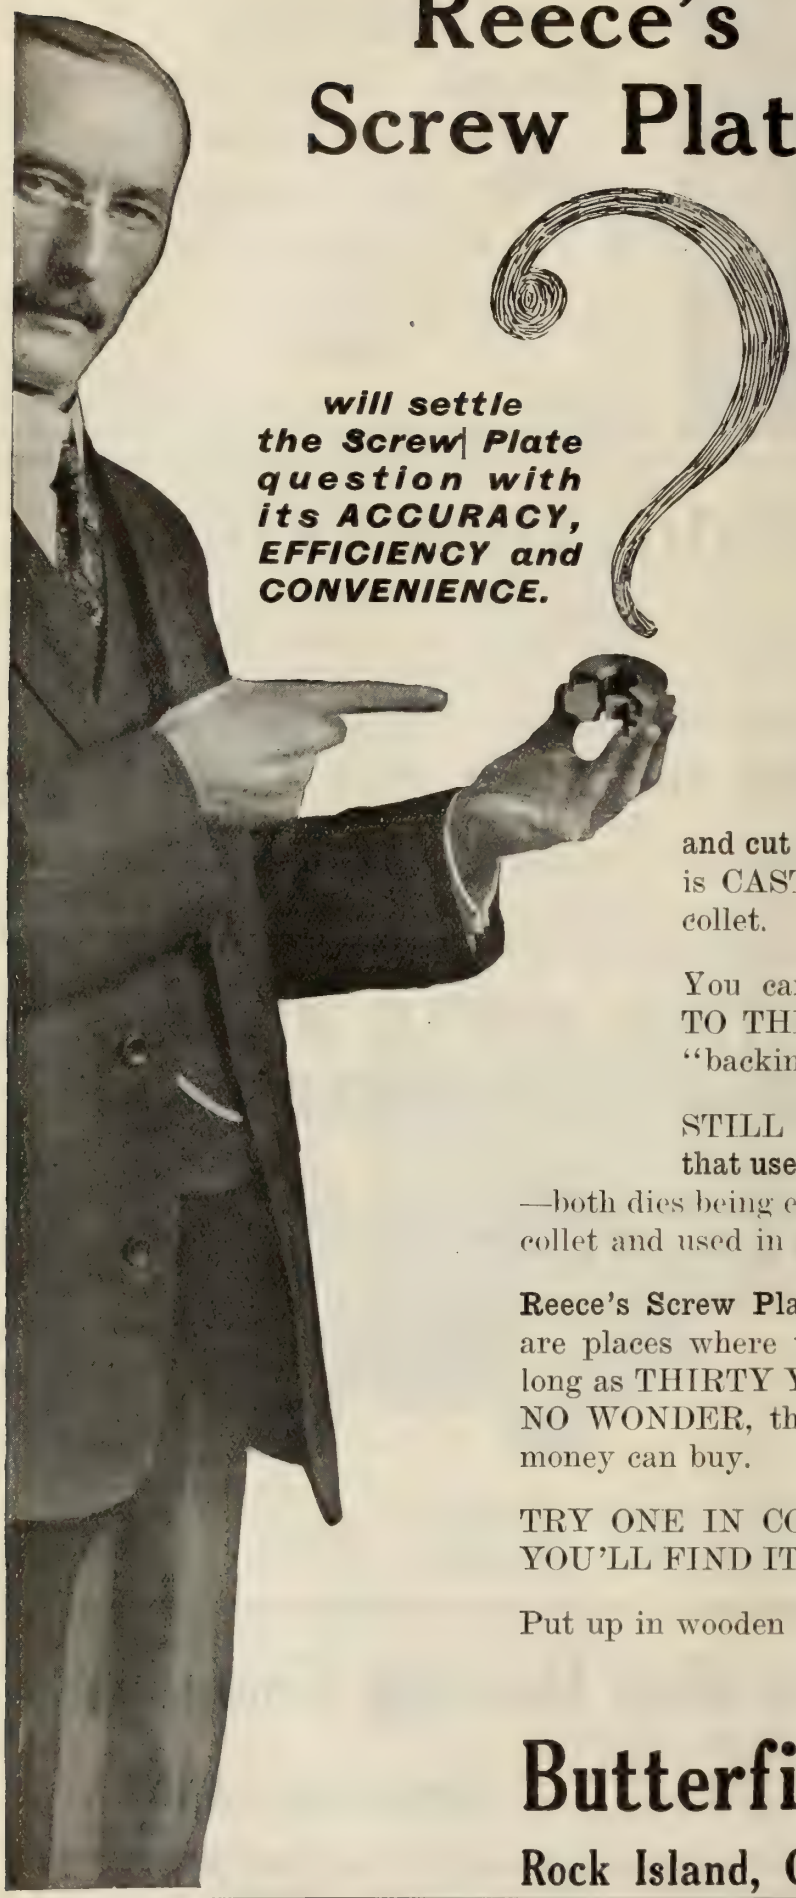
# Reece's Screw Plate





***will settle the Screw Plate question with its ACCURACY, EFFICIENCY and CONVENIENCE.***

Reece's Screw Plates are ADJUSTABLE, and they have all the advantages of a solid die with none of the disadvantages. To cut smaller, simply turn in the adjusting screws on either side of the collet. To enlarge turn these screws **out,** loosen cover, push back dies and tighten cover.

**It is impossible for the dies to loosen and cut cross threads, because** the guide portion is CAST SOLID with, and is a PART of, the collet.

You can cut PERFECT THREADS CLOSE TO THE SHOULDER with a single cut. No "backing and filling" is necessary.

STILL ANOTHER BIG ADVANTAGE—**one that users of hand-threading dies will appreciate** —both dies being exactly alike, they can be reversed in the collet and used in a lathe or other machine.

**Reece's Screw Plates are practically everlasting.** There are places where they have been in constant use for as long as THIRTY YEARS before new dies were necessary. NO WONDER, they're made of the best tool steel that money can buy.

TRY ONE IN COMPETITION WITH OTHERS AND YOU'LL FIND IT AN INVALUABLE TOOL.

Put up in wooden boxes that will fit well with your kit.

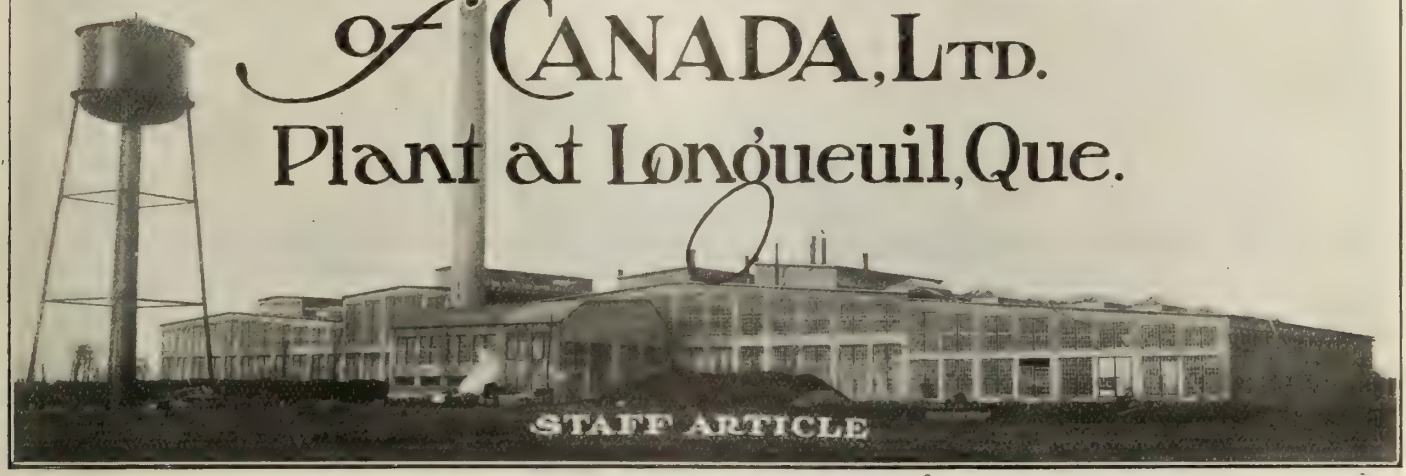
---

## Butterfield & Co., Inc.

**Rock Island, Que.** **Derby Line, Vt.**

# ARMSTRONG WHITWORTH of CANADA, LTD.

## Plant at Longueuil, Que.



*The establishment of a plant for the manufacture of crucible steel for such purposes as taps, dies, drills, etc., marks a new era in the history of Canadian industrial enterprise, and goes to show that there is not only a great opportunity to be taken advantage of, but gives expression also of unqualified confidence in the future development possibilities.*

FOR the most part, the greater portion of that large amount of British capital which has been invested in Canada has been placed in purely Canadian concerns operated by Canadians. Instances are few, where propositions due entirely to British initiative, have been launched in Canada. One of these however, is the new crucible steel plant of the Armstrong-Whitworth Co. at Longueuil, P.Q., which is to be the Canadian branch of the parent factories in Manchester and Newcastle, England. The plans were drawn in England but the construction of the buildings was entrusted to the well-known contracting firm of E. G. M. Cape & Co., of Montreal. M. J. Butler, C.M.G., took care of the machine installation and the various engineering problems.

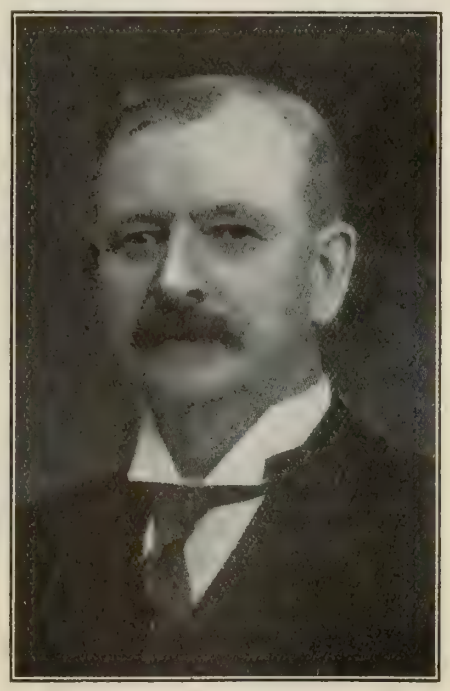
### Plant Site.

Longueuil was chosen as the site of the new plant for various reasons, chief among which, were the facts that sufficient land could be obtained. not only for present requirements, but plenty for all future needs; that the town is ideally situated for the accommodation of all the employees that the company will require; and that the shipping facilities are good. Again, the head office of the company in Canada is located in Montreal and thus the plant can at all times be in close touch with its head office. Montreal, too, being an ocean port and the commercial capital of the Dominion, makes the plant site choice an ideal one.

The property of the company extends from the river front back to and beyond the line of the Quebec, Montreal, & Southern Railway, which is a steam road forming part of the Delaware and Hudson system, and has a frontage on the river of about a quarter of a mile. The town of Longueuil is located on the south shore of the River St. Lawrence, almost directly across from the town of Maisonneuve, the eastern suburb of Montreal, and the company's land consisting of about two hundred and fifty acres, is located on the eastern boundary.

### Lines of Product.

The manufacturing output of the company will consist of high speed and crucible steels and high speed steel products, such as taps, dies, punches, mining drills, milling cutters, twist drills, reamers, and tool steel rolled and hammered in its various sizes and sections. The output will thus be of such a nature as to lend itself readily to motor truck transportation, and it is planned to maintain such a service between the works and the city of Montreal. There are two ways open to these vehicles of reaching the city, namely, by the excellent ferry service of the Canada Steamship Lines, and via the Grand Trunk Victoria Jubilee Bridge. For the period during the winter when the river is frozen there is, of course, only the latter way of reaching the city.



M. J. BUTLER, C.M.G.
Managing Director Armstrong, Whitworth of Canada, Ltd.

### Factory Buildings.

The buildings are entirely of reinforced concrete with steel frame work supporting the crane runways and the roof, while the side walls are practically huge windows. The main building is in the shape of an L. The present structures are built with the idea of future extensions, the east wall being of a temporary nature and consisting almost entirely of glass. Because of the fact that these future extensions were kept in mind so carefully when the plant was designed, the present length of the building is really the future width, and this is impressed on one the moment the building is entered. The bays all run in the short direction as also do the monitors, which are located over each main bay. In these monitors are also installed many glass ventilators. All of the steel was obtained from the Dominion Bridge Co., of Lachine.

It was decided to perform one operation only, or a certain series of dependent operations in each bay and the whole structure is designed to that end. There is a traveling crane in each main bay, the runway in each case extending throughout the whole length. In the

PARTY LEAVING MONTREAL STATION TO TAKE PART IN PLANT OPENING.

business of manufacture, furnaces and ovens, enter largely into the process, therefore it was deemed necessary to place a small bay some fifteen or twenty feet wide between each main bay. The furnaces have been so arranged that their chimneys will all lead up through the narrow bays thus allowing the full floor space in the main bays to be served by the traveling cranes. The main mill is 550 feet long, and the length of the mill for part of the distance is 100 feet and, for the remainder, 175 feet.

All the raw material is delivered to the plant by rail over the Q.M. & S. Railway. Two tracks enter the shop from the north and these run the whole width of the steel manufacturing shop. Thus material can be delivered to any bay desired. Further, material can be moved from one department to another by means of these two tracks as the plant is equipped with trucks to run on these tracks. When delivered to any bay, the material is handled by the traveling cranes, making shop transportation of material quite a simple matter.

### Mixing Room—Main Bay I.

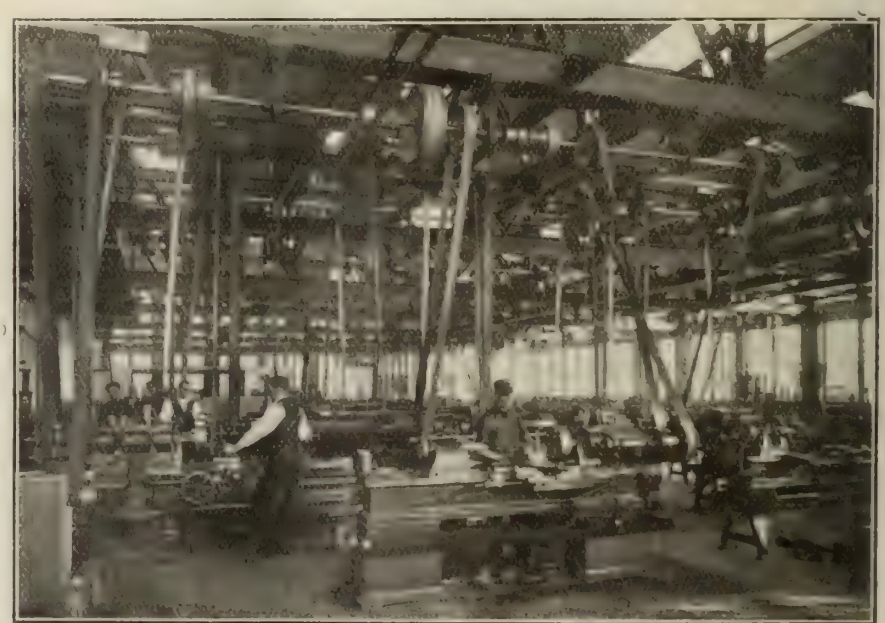
The mixing room, which really consists of the most northern bay of the shop, is 50 feet wide, and is equipped with a 5-ton crane. In this bay the alloys are received, and also the ore of the base metals. The alloys are received in the refined state. Here the two are mixed according to specifications received from the confines of the chemical department, where there are being constantly pursued experiments of various natures. After the alloys and base metals have been mixed, they pass on to the next department, which is the coke oven bay. Between the two main bays, however, there is located a minor bay some fifteen feet wide. The coke ovens are so arranged that their chimneys are in the small bay and they have a direct passage to the roof.

### Coke Oven Bay—Main Bay II.

In the coke oven bay there are installed two sets of furnaces each having three holes. The bay is 50 feet wide and is equipped with a five-ton electric traveling crane. The two furnaces are similar and are of a patented design which has been improved and perfected in the Manchester works of the firm. The basic metals and ore after leaving the mixing room arrive at the coke oven bay on trucks which roll on the tracks. The mixed material is placed in crucibles and these crucibles are then placed in the coke ovens. Each hole of the coke ovens is capable of holding four pots or crucibles. The capacity of the two coke ovens at one time is thus twenty-four pots, and the fires are some six feet below the level of the floor of the shop. The crucibles are lowered into the holes or pits which are three feet eight inches deep.

### Crucible Handling.

The crucibles are handled entirely by means of tongs which require some expert work on the part of the men, the pots being lowered into the pits and being withdrawn by these means. When the contents have been melted, the pots are removed from the pits and, immediately the pot is on the floor, a second man with a pair of tongs of different design picks up the pot and carries it to the cast iron ingot moulds. With the same tongs, the man tips up the crucible and pours out the steel into the ingot moulds. In each pot there is from sixty to eighty pounds of steel, and the smallest of the ingots requires about one hundred pounds of the metal. All the various sizes of the cast iron moulds are in the casting pits, which are part of the coke oven bay. The pouring of the steel is a very delicate operation indeed, great care being taken to prevent the molten metal from touching the sides of the cast iron moulds. The latter are always heated before the metal is poured, but even then the difference in the temperatures of the two metals is so great that the iron will chip and flake if the molten steel comes in contact with the mould sides when being poured. Extreme care is also taken to prevent the metal from piping upon cooling. After the removal of the ingot from the mould it is carefully examined for flaws such as chipped pieces of cast iron, blow holes, uneven surfaces, piping, etc. If any flaws are



MACHINE SHOP LOOKING FROM NORTH WEST CORNER.

discovered they are immediately ground out.

### The Annealing Furnaces

The next bay is a narrow one being but twenty feet, and where the annealing furnaces are located. These are of a patented design, the chimneys having clear head room above. The furnaces open into the casting pit and coke oven bay. After the ingots of steel have been ground, they pass on and are placed in the annealing furnaces, and while there undergoing the heat treatment, not one bit of free oxygen comes in contact with the steel. If free oxygen were to come into direct contact under the high temperature of the furnace muffle, the oxygen would tend to combine chemically with the alloys which entered into the composition of the steel. After the steel emerges from this furnace the product is ready for use. Among the famous brands of Armstrong-Whitworth steel that are made by this process are the A. W. Premier, A. W. Ordinary, A. W. Special, and T Y R. Before these ingots progress through the plant, they have to undergo a final test by an expert and, when the steel has passed this, it is ready for working into the various shapes.

### Converter Room—Main Bay III.

This, the third main bay, is 75 feet wide, and contains a 15-ton electric traveling crane. The base metal is received here, as in the mixing room, but in larger quantities. The ore and alloys which come in on the cars are here unloaded and mixed. Instead of crucibles, a steel converter capable of producing at least fifteen tons of steel per day, will be installed. The particular type has not as yet been decided upon, but it will be either a Stocks oil-fired of the latest type, or one of the improved type electrics. This bay is also equipped with modern casting pits and annealing furnaces. The steel produced in this department will be a high quality carbon steel similar to the Dura brand, with tempers from No. 5 to No. 8. Steel of this quality is used for punches, dies, cold chisels, mining drills and similar tools. In this department the same extreme care has to be exercised to produce ingots of the same perfect structure as those obtained in the High Speed Steel Department.

### Rolling Mill Bay—Main Bay IV.

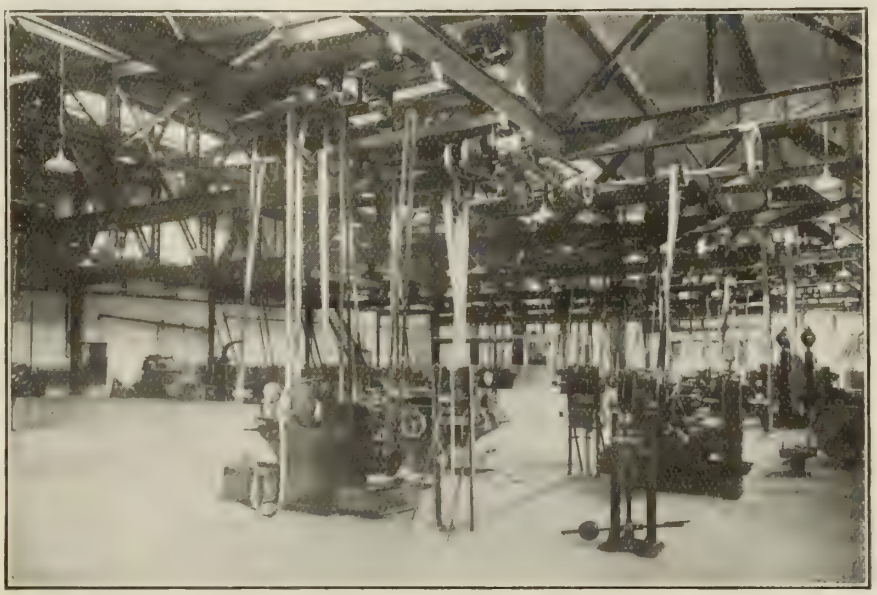
This bay is 60 feet wide and is equipped with a 5-ton electric traveling crane. There is also installed a 12-inch Lamberton mill, which is driven by a 300 h. p. Canadian Westinghouse direct current reversing motor of 500 volt type. The motor and switch board are entirely enclosed in a fire-proof room of galvanized metal, and all the starting resistances, and all the various wiring in connection with the starting and reversing apparatus, are placed below the level of the floor of the little motor enclosure. They are, of course, quite accessible in case of any derangement of same, and the switch board operator when attending to his duties at the board can have an uninterrupted view of the mill through a glass door. The motor is connected to the mill through the medium of a Lamberton slip clutch and, a 16-ton cast iron fly wheel is mounted on the mill shaft.

On the north side of the bay is a heating furnace for treating the ingots of steel before rolling them. The chimney of this furnace is placed so that it leads up through the minor bay between the third main bay and this the rolling mill bay. While the steel is being heated here, it is also away from the effects of free oxygen when in the muffle of the furnace. This precaution is found necessary in each case to preserve the structure of the material as free oxygen is very active chemically in the presence of great heat, and would tend to combine with the elements which give to the steel its physical properties for which it is so justly famed. It is thus imperative to preserve intact the composition of the steel. When billets are removed from the furnace, one would naturally think that air would enter the muffle, but experience has shown that the outward rush of the heated gases from the muffle keeps out all air tending to enter the muffle. On the other side of this bay is located a reheating furnace.

The billets are removed from the heating furnace and put through the rolls, and after the bars leave the rolls they are straightened, the large ones on a cast iron straightening plate 15 feet long by 5 feet wide, while the smaller bars are straightened in a reeling machine manufactured by Samuel Platt of Wednesbury, England. From the straightening operation, the bar goes to a shearing machine manufactured by Craig & Donald, of Paisley, Scotland. The bar is here trimmed of any shear ends or other defects. There is also located here a roll lathe for the machining of rolls for special sections and for the repair of standard section rolls. The standard sections rolled are rounds, squares, octagons, and flats, to four inches in diameter.

### Hammering Bay—Main Bay V.

Passing on through the narrow chimney bay to the south, the hammering bay is entered. This is 50 feet wide and is equipped with a 5-ton electric traveling crane. Here all billets that require hammering are brought. Among the varieties of steel that it is necessary to hammer is the high speed tool steel from which is made the various small tools such as milling cutters, drills, taps, etc., etc. A very complete range of hammers is found here, and all are of the latest design of steam type. They were manufactured by the John Bertram & Sons Co., of Dundas, Ont., and by the B. & S. Massey Co., Manchester, England. There are installed hammers of the following sizes:—3 ton, 1 ton, 12 cwt., 8 cwt. and 4 cwt., and each is fitted with all attachments to produce any size, type, or shape of bar. It is the intention of the company to manufacture all kinds of steel forgings when the factory is completed and the business fully established. There are seven furnaces of various sizes to accommodate the various hammers, situated so that they open on this bay, and the furnaces are so fixed that they chimneys are in the two narrow bays on either side of the hammering bay. After hammering, the billets go to the swing grinders

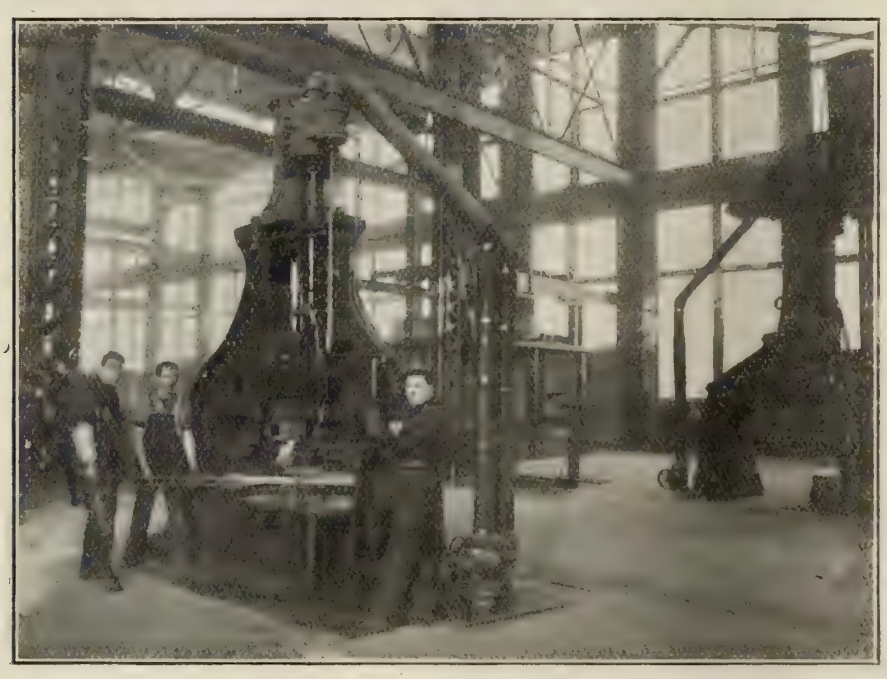


MACHINE SHOP SHOWING STORE ROOMS AND TOOL STORES IN BACKGROUND.

where all defects such as laps, seams, etc., are ground out.

**Warehouse Bay—Main Bay VI.**

Still traveling to the south, we pass on to the warehouse bay. The length of the shop is here increased to 175 ft. The width of this bay is 50 feet. There are here eight rows of racks made up of individual sections of special designs, each individual rack consisting of sixty compartments of varying sizes. There will be stored here a large stock of the finished bar steel when the factory is in operation. The racks are constructed of 1¼ inch wrought iron pipe and present a very attractive appearance. There is a 5-ton electric traveling crane which operates on a runway extending down the whole length of the bay, also several Reiner straightening machines for straightening and reducing bars to their exact standard size. There are also to be found here two power hack saws manufactured by E. C. Herbert, Manchester, England. Non-oxidising furnaces are also installed in this bay, where bars that require this treatment are annealed. The annealing causes all internal strains to be removed from the steel and makes a homogeneous structure of a very fine grain.



VIEW IN HAMMER BAY.

As has been stated, this bay is the first one whose length exceeds 100 feet. The extra 75 feet extension is toward the east where is located the hardening department.

**Hardening Department.**

This shop consisting of the eastern end of the warehouse bay, extends over the whole width of the latter namely 50 feet, and is 75 feet long. Perhaps in no other department of the whole plant does there rest so much responsibility with the workman as in the hardening department. Its importance cannot be too strongly emphasized, for here the very finest steel can be ruined by an unskilled man. The whole of the operations here executed are of a highly scientific character. On entering from the warehouse room there is located to the left a large patent tempering and hardening furnace, which is also of the non-oxidizing type. This furnace is capable of heating steel bars or shear blades up to 96 inches in length.

Situated in front of this hardening furnace is a round wooden stave brine tank 6 feet in diameter and 16 feet deep. This is used for treating the water hardening type of steel. The capacity of the tank is 2,800 Imperial gallons. Various types of tempering and hardening furnaces are arranged around the three walls of this room, several of which are of Armstrong-Whitworth design and have been built entirely by the engineers and employees of the firm. Four of the furnaces are, however, of the Stewart type, manufactured by the Chicago Flexible Shaft Co. There is also one electrical furnace installed, to a large extent for experimental purposes. This was manufactured by the Canadian Hoskins Mfg. Co., Walkerville, Ont. Between the furnaces along the walls are cooling benches, each equipped with air blasts and water pots. On one side of the department are situated the furnaces for the tempering of high speed steel, while on the other side are to be found the furnaces for tempering carbon steel. These furnaces are all of the oil blast type, receiving oil from an auxiliary tank located on a roof truss. This tank receives its oil from the main storage tank which has a capacity of 15,000 Imperial gallons. The oil which is light fuel oil is pumped from the main storage tank to the auxiliary tank in the roof truss. Situated in the centre of the hardening department is a steel oil hardening tank. This tank is let into the floor and has a capacity of 860 Imperial gallons. On account of its central location it is easy of access for all of the furnaces.

The welfare of those employed in this department is well looked after. Over each furnace is located a steel hood which collects all the fumes and gases and conveys them through pipes to the atmosphere. For this reason the air is practically free from all objectionable features. Both high pressure and low pressure air blasts are available in this department. The high pressure is furnished by a Keith fan, while the low pressure air is supplied by No. 5 American blower manufactured by the American Gas Furnace Co., of Elizabeth, N.J.

**Machine Shop Bay**

This bay is the largest one of the plant, the width being 100 feet and its length 175 feet. The floor is of hardwood throughout. In the western end is situated the superintendent's office and those of his assistants. On the top of these offices, the drawing department is located. In the eastern end of the bay are to be found the tool store rooms. Lavatories for the men are situated on a mezzanine floor off the wall at the northern side of the bay. This wall separates the machine shop from the warehouse bay and the hardening room. The lavatories are furnished with the most modern equipment, and it shows how, even in the smallest details, the welfare of the men has not been overlooked. Situated as it is in the gallery, no floor space in the body of the shop is utilized. The light in this department through the spacious windows in the walls and the generous area of the skylights is unexcelled anywhere.

On the hardwood floor of the bay is located the large number of machines used in manufacturing the various high speed tools. As will be noted later, a number of these machines have been specially designed for the work which they will be called upon to execute, this having been found an absolute necessity because the rapid, economic, and accurate production of small, high speed steel steel tools cannot be accomplished through the medium of machines of standard design. The equipment is all so arranged that machines executing similar operations are in a group, and the groups again are so arranged that the progressive operations are facilitated

as much as possible. Thus, as a particular piece travels through the shop, the successive operations are performed on the adjacent machines, and the journey through the shop is continued in the same general direction all through. Further, the present complement of

MACHINE SHOP LOOKING NORTH EAST.

tools, although complete in itself and arranged to excellent advantage for rapid, accurate, and economic production, forms only a portion of the equipment which the shop has been designed to accommodate. When the increase in business causes the present equipment to become inadequate, it will be in no way necessary to remove any of the present tools from their positions, nor will the line shafts have in any way to be altered for the accommodation of additional machines.

The steel enters the shop and is immediately placed in the hack saws, the round bars most commonly used in the manufacture of high-speed steel machine tools having all been hammered and annealed before they pass into the machine shop bay. The power hack-saws cut these round bars to the various lengths required. Among the various hack-saws there is one automatic power saw. This machine can be adjusted so it will cut automatically a whole bar into long or short lengths as desired, and have each length similar without attention or adjustment after the first setting. These machines are all of British manufacture being from the shops of the E. C. Herbert Co. From the hack-saws, the steel goes to the centering machine where centers are placed on both ends of the pieces of steel. This centering machine was manufactured by the Hendey Machine Co., of Torrington, Conn. Next in order come the Reed-Prentice, and the Lodge & Shipley lathes. On these lathes the pieces of steel are turned down to size, in the process of being made into milling cutters, reamers, drills, etc. This group of machines is driven from a line shaft, which is in turn driven by an electric motor. The whole shop is laid out so that each group of machines doing similar work is driven by a line shaft, which is driven by its own individual motor. The motors used are of various types, some are Canadian Westinghouse, some Canadian General Electric, and others are of British manufacture.

Nearby is a group which comprises several machine tools especially designed and constructed for the Armstrong-Whitworth of Canada. These machines perform certain operations in the manufacture of twist drills, and they as well as certain others of the automatics are set at a slight angle so that when long bars are placed in them they will not interfere with neighboring machines. The angle is only a slight one, simply allowing the bars to miss the other machines but, to prevent the belts from running off the pulleys small iron guides are placed so as to guide the belt. Another group of machines nearby consist of Landis grinders, upon which is executed the rough grinding of small tools before these are fluted.

Milling cutters are gashed on Browne & Sharpe and Cincinnati Universal milling machines specially designed for this work. Each machine is driven by its own 10 h.p. motor. Nearby is another specially designed machine used for machining tangs on the end of drills and squares on the end of taps. A group of specially designed machines take care of tap threading. Another Cincinnati milling machine is also equipped for the express purpose of fluting taps. Several drill presses are located throughout the shop, these including both single and twin spindle types.

The finishing grinders were manufactured by the Norton Grinding Co., of Worcester, Mass., after Brown & Sharpe designs. On these machines are executed all the operations in connection with the finishing to size of all tools, such as drills, cutters, taps, reamers, etc. A little further along is a group of machines upon which the points of drills are ground at the proper angles.

All drills are tested to double working capacity on a powerful Bertram single spindle drill press before being put into stock for shipment. This machine is driven by a 20 h.p. Canadian Westinghouse direct current variable speed motor.

Another special machine is one designed by the Armstrong-Whitworth Co., on which hobs for worm gears and gear cut-

PART OF HAMMER SHOP, SHOWING ONE OF THE FURNACES AND TWO HAMMERS.

ters are machined. There is also a John Bertram & Sons shaper located in this bay, which is driven by an independent 10 h.p. motor. Meantime, there is abundance of floor space in this bay for the further addition to the machine tool

equipment. The shafting and hangers were all supplied by the Canadian Fairbanks-Morse Co., the hangers being all of the ring oiling type. The pulleys were supplied by the Dodge Mfg. Co., Toronto, and the belting by the J. C. MacLaren & Co., Montreal.

### The Boiler Room.

Adjoining the main building, but on its west side, are located the boiler room and the power house. These are under one roof and separate from the main structure. A battery of two Babcock & Wilcox boilers is installed, each unit being of 500 h.p. These boilers are fired by hand and operate under natural draft. The stack is 150 feet high and has been designed to take care of 2,000 h.p. with the ordinary provision for overload. The stack is nine feet inside diameter at the top and was built by the Alphonse Custodis Chimney & Construction Co., of New York City.

There are two principal uses to which steam is put. One is for the steam hammers which require about 400 horsepower, out of the total capacity of 1,000 horse power generated. The second use of steam is for the purpose of heating. The exhaust steam from the hammers is piped into the heating system, a back pressure of three pounds being maintained in the exhaust line by Cochrane multiport back pressure valves. Before reaching these valves, the steam passes through Bundy oil separators. Should the exhaust steam at any time not be sufficient to maintain the required back pressure, live steam is introduced into the heating system through Mason reducing valves. The steam pipes are led through conduits in the concrete floors and, to present an uninterrupted floor space, these conduits are covered with steel plates. Thus the pipe lines are accessible at all points at a moment's notice.

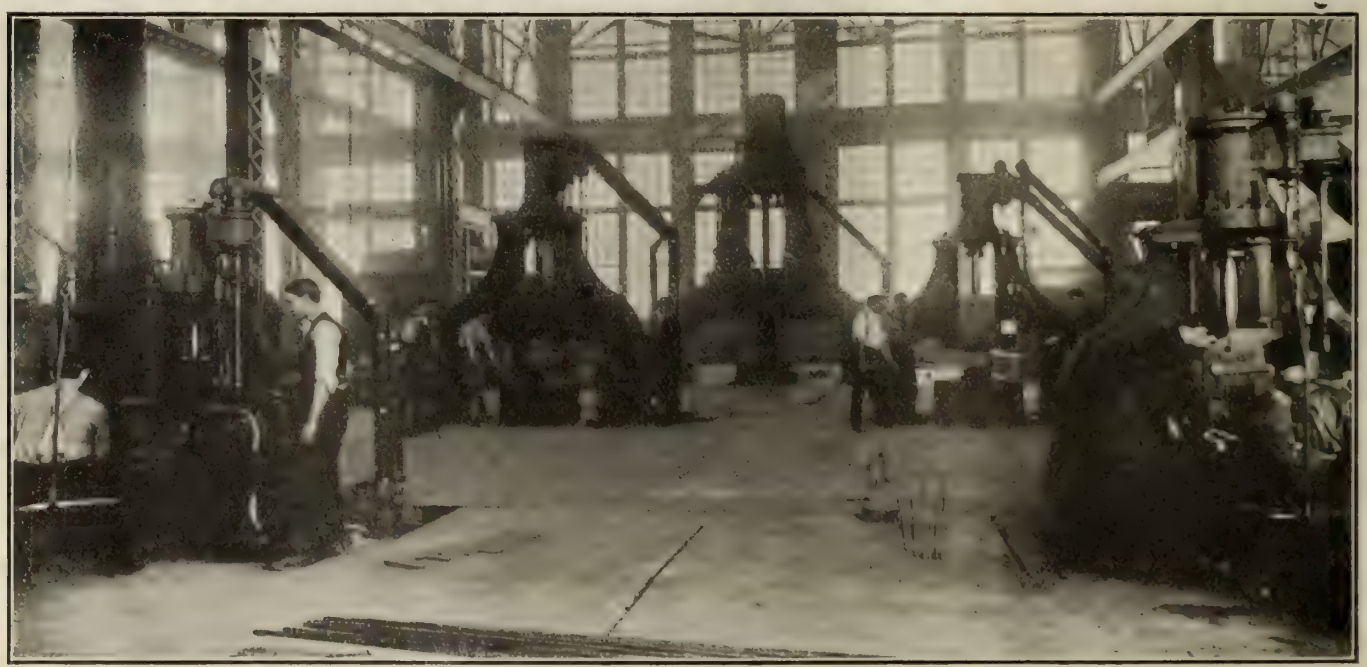
The radiators are placed along the walls extending from the floors to the bottom sills of the windows, and an extremely generous radiating surface is provided so that, in the most severe weather, no difficulty will be experienced in maintaining the desired temperature. Traps are fitted to each radiator thus all returns are condensed. Two simple Bawden vacuum pumps, in conjunction with Webster vacuum valves, return all condensation to a low pressure Cochrane feed water heater. The boiler feed pumps are of Smart-Turner manufacture, and are of the Duplex, outside-packed, double acting pattern.

### Water Supply.

A very unique system of water supply has been designed to meet the requirements of the plant. The water is obtained from the St. Lawrence River some 1,800 feet distant from the main supply tank. The main tank was furnished by the Chicago Bridge Co., and is built on a steel tower on the west side of the plant. The height of the tank top above the ground is 166 feet. The tank embodies some very interesting features in design. The total capacity is 70,000 Imperial gallons, but is so designed that only 30,000 gallons are available for general purposes, the other 40,000 gallons being reserved for special fire protection. This is accomplished by special arrangements of piping in the tank interior. In the power house there is a mercury manometer for registering the height of the water in the tank, and this provides an easy method of keeping track of the quantity of water. The device really consists of balancing a column of mercury against a column of water.

There are two centrifugal, direct connected, motor driven, Canadian Allis-Chalmers pumps located in the pump house on the river bank, the motors connected to the pumps being Canadian General Electric, alternating current, and of 50 h.p. each. The intake consists of a sluice way or tunnel from the river to underneath the pump house, the smallest cross section of this tunnel being three feet by two feet. There is an 18 foot suction lift and each pump is capable of supplying 770 Imperial gallons per minute against a pressure of 75 pounds per square inch, which pressure is equivalent to discharging against a head of slightly over 170 feet. The discharge pipe is 8 inches in diameter. In the pump house is a special arrangement of piping which allows either pump to be operated independently of the other, delivering its full capacity.

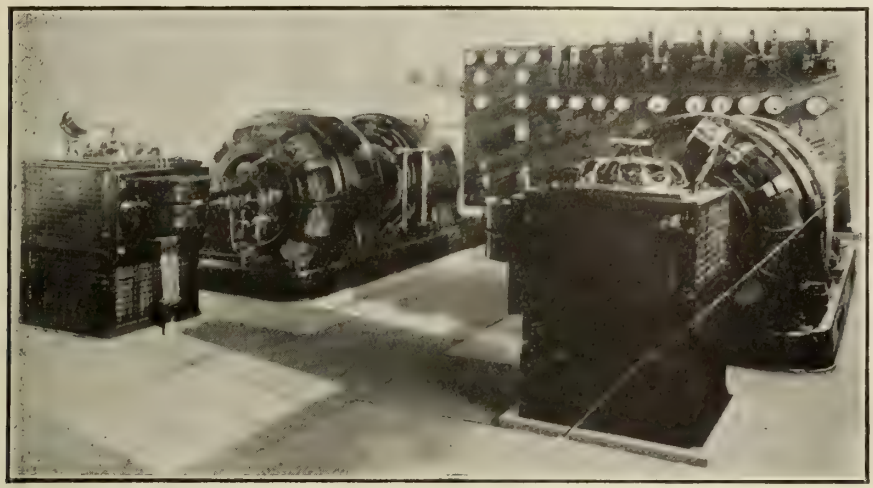
These pumps can also be operated together in two different ways, namely, in series, or in multiple. When in series, the one pump receives water from the river and discharges into the second pump; then the combined output of the two pumps is the same as for one pump but the water is discharged against twice the pressure, or to express the same in figures the two pumps will discharge 770 Imperial gallons per minute against a pressure of 150 pounds per square inch, or against a head of 345 feet. When operated in multiple, the pumps discharge at the normal pressure of 75 pounds per square inch but twice the quantity is discharged, namely, 1,540 gallons per minute. This pumping unit thus provides the plant with a very efficient water supply, not only for ordin-



VIEW IN HAMMER BAY LOOKING EAST AND SHOWING ALL FIVE HAMMERS.

ary use, but it is particularly efficient in case of fire, providing a pressure which is far in excess of that usually obtained in the mains of most cities under the most favorable conditions. The reserve of 40,000 gallons in the tank always insures a supply with which to fight a fire until the pumps can be put into action.

A further very interesting feature in connection with the water tank is the fact that a water heater is situated at the bottom of the tank trestle. Live steam is supplied to this heater and circulation is obtained through the thermo-syphon system principle, making use thereby of the fact that warm water will rise above cold water. This heater is part of the equipment supplied by the Chicago Bridge Co. The water being always kept in circulation is prevented from freezing and causing a tie-up in the supply.



MOTOR GENERATOR SETS IN THE POWER ROOM SHOWING STARTING APPARATUS AND SWITCHBOARD.

### The Transformer House

Some two or three hundred feet to the south of the main building is located the concrete transformer house. Current is received from the Montreal Light, Heat & Power Co. at 22,500 volts. Installed in the transformer house are six of the latest type of North British transformers which step the current down from 22,500 volts to 2,250 volts. In addition to the six transformers, there is a duplicate set of lightning arresters and high tension oil switches furnished with remote control and interlocking devices. Further, these high tension oil switches are equipped with overload release relays, operated by means of current transformers.. The current is carried to the power house through underground conduits.

### The Power House.

In the power house are two Bruce-Peebles motor generator sets, through the medium of which the direct current electricity at 500 volts in use throughout the plant, is obtained. The d.c. generator ends of these sets are each of 350 kilo-watt capacity, while the guaranteed power factor of the motor ends is unity or 100 per cent. The units are very compactly designed, while the switch boards which are extremely well equipped and present an extremely neat appearance, were built by the electricians of the company. The motors of the motor-generator set are synchronous machines and the method of synchronizing them is unique. Direct current electricity is used on all the variable speed motors throughout the shop, and these include all the crane motors as well as the motors in the machine shop.

In the boiler room is located a simple Armington & Sims 50 horse power steam engine fitted with a flywheel governor. This engine is of horizontal design, runs at 250 r.p.m., and is belt connected to a 50 kilo-watt, 500 volt, direct current, Westinghouse generator. This unit is held in reserve in case a breakdown should occur in the transmission lines of the power company.

### General.

Both the natural and electric lighting systems are exceptionally good and all the conditions under which the workmen labor closely approach the ideal. The equipments and the appointments of the plant in general have been carefully studied and in no department have any details been overlooked.

Foremen of the various departments have been brought over from the parent plants to educate the local men along the different lines of the industry. The policy of the company has been to employ as far as possible Canadian labor. It has also been the policy of the company to purchase as far as was possible, tools, machines, supplies, and equipment from local firms.

The advent of this plant into the circle of Canadian industries marks a new era. It is the only crucible steel plant in Canada, and the quality of the steel to be produced, it is claimed, will not be surpassed by any other high speed tool steel in the world. Such an institution is one of which all those identified with the engineering pursuits of this Canada of ours should be justly proud. The general offices of the company are at 22 Victoria Square, Montreal, and the officials of the company are as follows:—

President—Sir Percy Girouard, K. C. M. G.

Vice-President — George G. Foster, K.C.

Director—John D. Noble.

Managing Director—M. J. Butler, C. M. G.

General Superintendent—W. Furniss Clarke.

Sales Manager—Lawrence Russell.

## SHELL ORDERS.

IT is expected that more than a hundred Canadian firms will eventually be working on an order from the Imperial Government calling for 250,000 shrapnel shells per month until the total number of 1,800,000 called for has been filled. Already, it is stated, fifty different manufacturers in Canada are employed in this new business, each taking some portion of the work to be done. Nearly all of the Canadian steel companies have put in the plant necessary for the business of shell-making, but the order embraces many concerns other than the steel companies. All the materials used are products of Canadian firms. How much material this order will take can be judged from the fact that four thousand tons of lead bullets will be used to complete it. British Columbia lead will be used for a portion of it.

Representatives of manufacturing firms from various parts of the Dominion have been at the Capital seeking information concerning the new industry, and expressing their willingness to place the facilities in their plants necessary for the work. By so doing very considerable employment can be given. It is stated that there is work enough for every firm in Canada which is in a position to manufacture one or more of the parts required. Some of the orders are for steel for French manufacturers. There is an indication that Russian orders also will be placed in the Dominion for this sort of war material, and if so an important new industry will be established in Canada to tide manufacturers over the war.

**A. K. Grimmer**, city engineer of Medicine Hat, Alta., has handed in his resignation.

# PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

## FLAT SPRING FORMING DIE AND INDICATOR.

By A. L. Monrad.

AN order came in for several thousand flat-formed springs, and was backed by a duplicate order if they were up to the standard of the sample furnished. As we already had some experience in this line, we concluded that accurate bending was the most essential point, and if anyone is looking for a cheap product of this kind, I think the method of manufacture here explained will be highly satisfactory.

### Forming Device.

The die we employed is sometimes known as a twin die. It will punch on either side as well as on top, as the case may be. On such a job it has been found to save three handlings of the work. The punch plate A, Fig. 1, is made of cast iron planed and finished to dimensions all over. On each side of the plate are milled out two slots to a driving fit to receive the four sub-press pins C, which operate the side T-slides D. These pins, C, are made of machinery steel, case-hardened, and each is secured to the plate A with a fillister head screw and two dowel pins. The sub-press pins are 1 inch square all the way except at the bottom where the ends are ground cylindrical to a plug fit in the bushing J. About the middle of the squares in the two end pins is milled a traversable

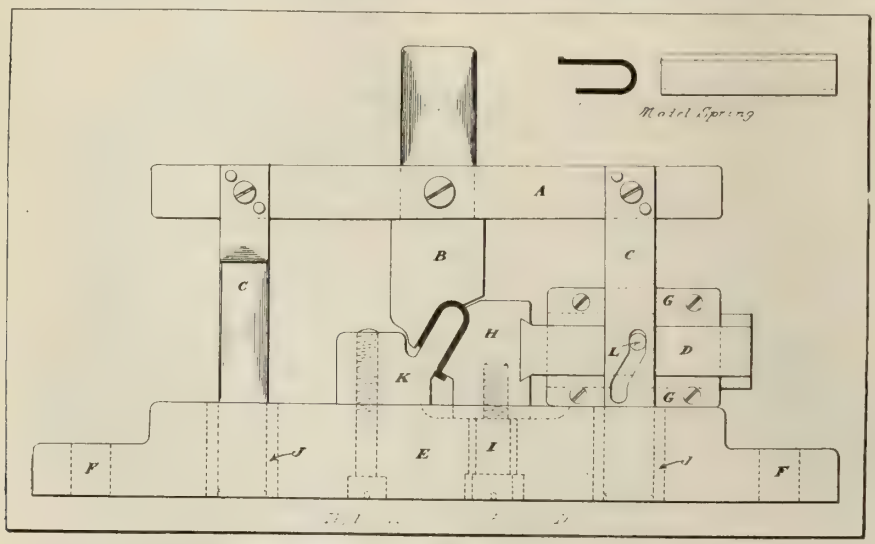


FIG 1.—SUB-PRESS SPRING FORMING FIXTURE.

3/8-inch slot to a true fit for a roller bushing connected with the T-slide D.

Forming punch B is made of low-grade tool steel, hardened and tempered to a straw color. It is held rigid by a driving fit through the cast iron plate A and a centre screw from each side. The exact shape of form is obtained by trying a few blanks before hardening. The bolster E is made of close-grained cast iron, planed on both sides and, when located in the press, is secured with two hexagon-head press bolts through the holes F on both ends. The T-slide block G which holds the T-slides D is made of cast iron, with a milled groove on each end to fit the T of the slides. These are secured with a sliding fit by two plates held with four machinery screws. The block G is fastened to the bolster E by means of two fillister screws and two dowel pins from underneath which are not shown.

The forming block H is made of low-grade tool steel and conforms to the shape of the spring required. This can only be determined by trying a few blanks in the press before hardening.

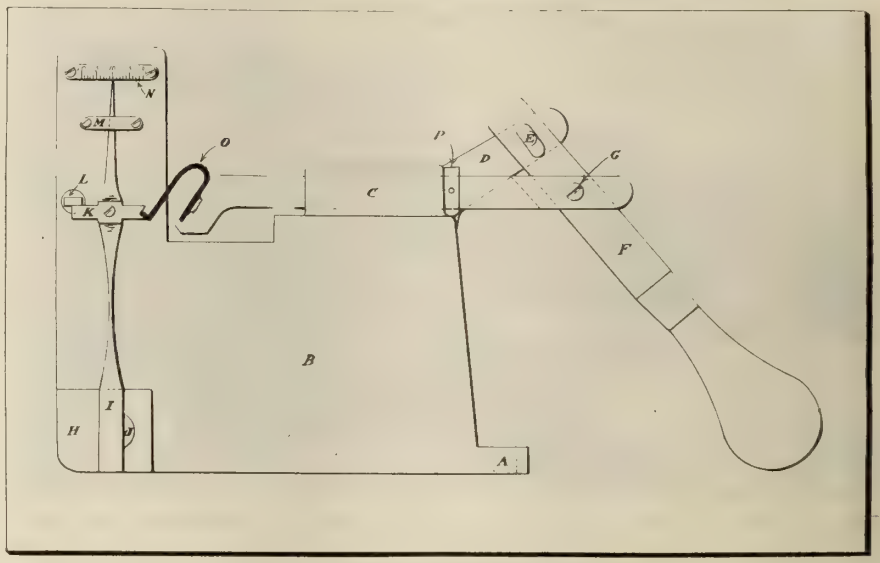

FIG 2.—SPRING TESTING DEVICE.

The sliding block is held to a sliding fit on the ends of the block H in the die bolster E, which has a rib on each side, and is retained in a movable position on each end of the block by a shoulder screw, I, with a large head to keep it firmly in position. On each end a dovetailed cut is taken to fit the T-slides D and, in this position, the block is secured to the T-slides, with no possible chance of getting out of place after once being located.

The stationary forming block K is made of tool steel and conforms to the shape of the spring required. This also can only be determined exactly, after trying a few blanks in the press before hardening. This block is held in position in the same manner as block H, with dowel pins to make it more rigid. The former is hardened in fish oil and drawn to a dark straw color. The T-slides, D, are made of machinery steel and case-hardened, being a nice sliding fit in the block G. The slides are held in position with a plate on each side and three fillister screws.

In the middle of the T-slides is driven in a head pin with a hardened steel bushing L on the end; this acts as a roller when traversing in the sub-press pin slot with a true fit on the sides. The die plate E is drilled and reamed to a driving fit for receiving the hardened steel bushings, J, which are ground and

lapped to a plug fit in order to guide and support the four sub-press pins C. When they are up to the highest point they remain in the bushing holes about ½-inch. In so doing they are well supported when taking the thrust on one side during the downward motion when forming the spring. This die was made for a press having a two-inch throw, and the T-slides had to have a lateral travel of about ⅜ inch. While the ram of the press is traveling, the slides D move the required distance by traversing in the slots of the two sub-press pins C.

The blanking was done in a press of the inclined type. With the end cut square, it forms the right angle and cuts off with one stroke of the press. The second operation is performed in a roller forming fixture, which is a very quick operation, but which could never be depended upon for accuracy, as they would vary from five to twenty-five thousandths from the proper shape. By sliding this formed blank in the die to the stop pin on the other side, it forms the shape from two sides at once with one stroke of the press, thereby giving it a uniform bend with a variation of only three thousandths.

### Gauging Fixture.

After being spring tempered to proper torsional elasticity, they are tested in the testing fixture, Fig. 2. This spring indicator is made so it can lay down flat on a bench or can stand upright and be bolted securely by the hole A. The plate B is made of cast iron, is hollow inside, with walls about ⅜ inch thick, and is planed on the bottom. The spindle hole C extends above, so that when the spring is in position it will clear the plate. An arm D extends out 45 degrees, and is about 1 inch thick. The top is planed and a pin E is driven in.

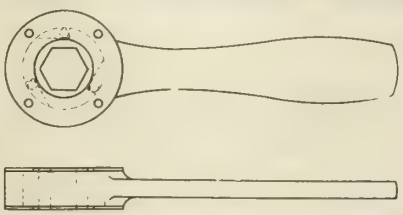
The lever F is fastened to the sliding spindle C by means of the shoulder screw G, and pivots about the pin E in the slotted hole, as shown. A wooden handle is driven on the other end of the lever. The corner block H is cast on the plate, and extends up about one inch. A ⅝-inch hole is drilled through this block and a slot milled through on top, leaving a part of the hole, as shown.

Different indicator points I are used for different widths of springs, and are held firmly in position by driving up the segment key J. In about the middle of the indicator is located an extension plate, K, held in a swinging position by a shoulder screw so as to give the spring a perfect seating, as it is indicated forward. A flat stop pin L is driven into the cast iron plate B at the end of the extension plate for the plate K to rest against. A cross plate M fastened with two screws holds the indicator down, and a graduated piece N serves to indicate the amount of the variation. Placing the flat spring O in the seat of the spindle C and moving the lever F forward to the ring stop P will register the spring to the proper tension.

## REVERSIBLE RATCHET WRENCH

By A. S. Loy.

THE drawing of the ratchet wrench is practically self-explanatory. The body is of mild steel and case-hardened, being bored to receive the tool steel centre piece which is broached out for the proper shape on which it is to be used. This center piece is cut away at the three points to receive the rollers which are of drill rod and are backed up or rather pushed into the narrow portion of the openings by small springs which are not shown. The centre piece is held in position by means of the thin steel disks riveted on either side. The centre projects up through these centre pieces so as to be flush at the sides. To reverse the direction of rotation, it is only necessary to turn the wrench over. The rollers have a good "bite" and take hold immediately, so that there is practically no lost motion, and it is possible to use this wrench in crowded places where the movement would not be sufficient for the ordinary type of wrench.

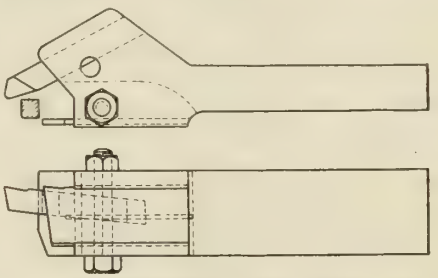


REVERSIBLE RATCHET WRENCH.

## A PISTON RING LATHE TOOL.

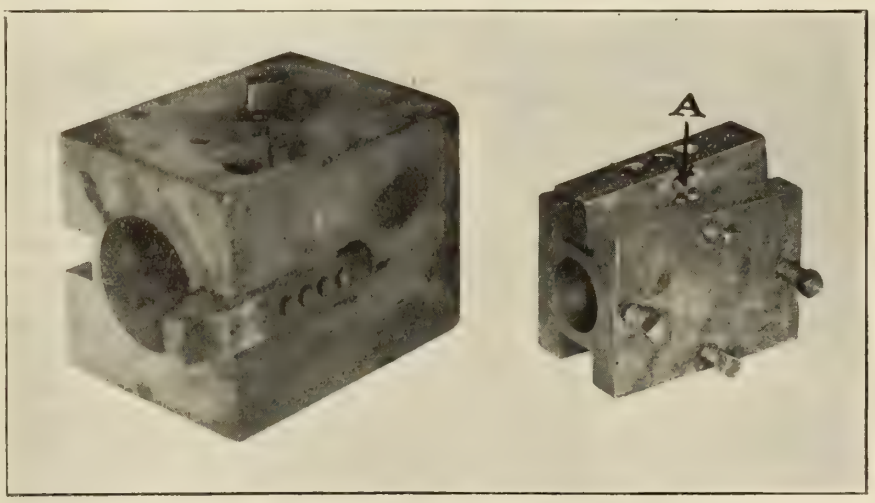
By D. S. Mann.

THE accompanying drawing shows a tool used in the turret lathe for facing and cutting off piston rings. The rings were both bored and turned with a regular piston ring attachment from the turret leaving the cross-slide free for parting the rings. In this case a multiple tool for cutting off the rings would be of no advantage as it was possible to cut them off singly and keep up with the boring and turning so that all the operations were completed simultaneously. Not



PISTON RING LATHE TOOL.

The facing tool was of ⅜ in. square being equipped with a piston ring grinder, it was also necessary to face one side of the rings.



KEYWAY DRILLING-OUT JIG.

## KEYWAY DRILLING-OUT JIG.

By A. E. Granville.

THE type of drilling jig shown is very convenient for drilling out keyways in shafts, either single or with two opposite each other. The body of the jig consists of a block of cast-iron, while the drill guiding strips are of tool steel hardened and drawn. The block is held on the shaft to be drilled by ordinary set-screws, but the bushings are held in place by a pointed set-screw. There are two locating spots on the side of the steel strip for each set of holes to be drilled. When one lot is drilled, the strip is moved forward till the pointed set-screw will enter the other spot, then the webs left between the previously drilled holes are drilled out, leaving very little to chisel out. The piece A shows two sets of locating holes on the side. These are used for opposite sides of the shaft.

steel held in place by a 5/16 in. pin, milled off and driven in at a taper, this tool being set far enough ahead, of course, to clear, by the time the parting tool has entered. The slot holding the parting tool was bevelled both top and bottom, and the tool holder body split with a slitting saw. A bolt through the body served to clamp the parting tool. Various widths of rings, if necessary, could be accommodated by moving the facing tool in its slot, it being but a moment's work to set for any particular size.

# Layout of a Four Piece Ship's Ventilator Cowl

By J. W. Ross

*The very practical piece of development and layout work herein described, although the direct answer to a query from a subscriber to Canadian Machinery, if well studied and understood, will be found to cover a wide field of sheet metal problems. The practice as set forth is applicable to many forms of irregular pipe bends and junctions and illustrates some distinct advantages of longitudinal over girth seams under certain circumstances.*

FIG. 1 shows a ventilator cowl built up of four pieces with vertical seams. This type of cowl is much preferable from its visual effect to that made up with girth seams. Fig. 2 illustrates the construction of the cowl, the layout of which may be drawn to any desired scale.

Measure off A B equal to 20 inches, bisect at P and raise the vertical line V P equal to 40 inches. Draw the overhang V C at right angles to P V and equal to 18½ inches. With E as centre and radius (equal to 25 inches) draw in the arc C K F J so as to be tangent to the perpendicular A J raised from A B. Raise the perpendicular B L M.

Locate the point G, which is 4 inches above the line A B and 2 inches from B L M. With G as centre and 2 inches radius, strike the quadrant M N D tangent to B L M. Directly above the point G locate D, which is on the quadrant M N D. Connect by a straight line the points D and C, thus completing the outline of the cowl. Now divide the back into four equal parts as shown by A J F K C. Similarly divide the throat sheet line into the same number of equal parts as shown by the points B L M N, and D. Connect these points by straight lines to their relative points on the back sheet line, as J L, F M, K N. These lines will be used as sectional planes and on them will be constructed the half sectional views.

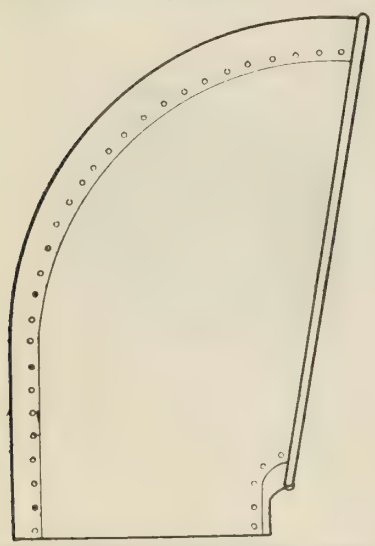


FIG. 1. VENTILATOR COWL WITH VERTICAL SEAMING.

With P as centre and radius P A, strike the semicircle A P° B, thus defining the half-sectional view through the plane A B. Bisect J L at Q, then with Q as centre and radius Q J strike the semicircle J Q° L. Again, with R as centre, describe the semi-circle F R° M. Similarly with S K and T C as radii, strike the half section views K S° N and C T° D, respectively.

It is the usual practice in this type of cowl to make the back and throat sheets each equal to one-sixth of the circumference and the side sheets each equal to two-sixths. On this principle, our patterns and templets will be developed. Divide the semi-circle A P° B into exactly six equal parts and locate the end points 1° and 2°. At right angles to A B project the lines 1° 1 and 2° 2, thus locating the points for the rivet lines. Divide the arc J Q° L into six equal parts, the extreme points 3° and 4° being projected at right angles to the plane J Q L, thus locating the rivet line points 3 and 4. Similarly, the arcs F R° M, K S° N and C T° D are each divided into six equal parts, their extreme division points being projected at right angles to their respective planes, thus locating the rivet points 5 6 7 8 9 and 10.

Erect the perpendicular 1 3 to the line A B, and with a suitable centre as at U, and radius U 9, describe an arc through the located points 9 7 5, and tangent to the perpendicular 1 3. The line 1 3 5 7 and 9 defines the rivet line for the back and side sheets. The rivet line for the throat and side sheets is drawn in a similar manner. Erect the perpendicular 2 6, and with a suitable centre draw the arc cutting through the points 6 8 4 and 10, and tangent 2 6.

For the development of the back sheet, take the distances A J, J F, F K and K C, transfer over to Fig. 3 and locate the points A J F K C on the straight line A C. Draw lines at right angles to A C through all these points. Measure off carefully along the curve the distance A 1°, Fig. 2, and transfer this over to Fig. 3 by measuring at each side of 1, locating the points 1° 1°, which will be equal to one-sixth of the circumference, through the plane having A B as diameter. Similarly measure J 3°, Fig. 2, and transfer to J 3°, Fig. 3. Again, transferring all the distances as F 5°, K 7° and C 9°, measured along the curve (or calculated), Fig. 2, to their respective locations in Fig. 3, an even curve is drawn in through these points by the aid of a flexible batten.

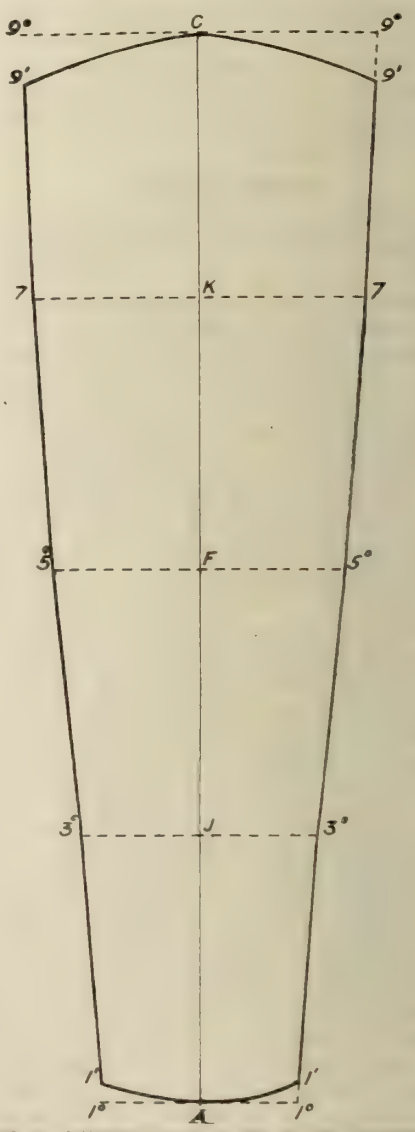

FIG. 3. DEVELOPMENT OF BACK SHEET.

It will be observed that in Fig. 2 the line 1 3 5 7 9 is shorter than the line A J F K C; this, then, will have to be shown in Fig. 3. From the located point E, draw a straight line to F, locating the point $F^1$ where this line intersects the rivet line, Fig. 3. Measure carefully along the curve from this point $F^1$ to the point 9. This distance is then measured from 5° to $9^1$ in Fig. 3. The distance $F^1$ to 1, Fig. 2, is next transferred to Fig. 3 as from 5° to $1^1$. Suitable curves are drawn through the points $9^1$ C $9^1$ and $1^1$ A $1^1$ respectively. This completes the templet for the back sheet; laps, of course, to be added as required. If the reader is in doubt about the curves $9^1$ C $9^1$ and $1^1$ A $1^1$, perhaps it would be just as well to prolong the rivet line from $9^1$ to 9° and from $1^1$ to 1°, thus leaving the ends square. It will require in any case to be "dressed" after being "blocked" or hollowed out.

The throat sheet is developed in a manner similar to the back sheet. The distances in Fig. 2, B L and L M, M N and N D measured along the curve, are transferred over to Fig. 4 and located on the straight line by the points B L M N D. Parallel lines at right angles to B D are drawn through these points. In Fig. 4, B 2° is made equal to B 2°, Fig. 2, which is also equal to A 1°, Figs. 2 and 3. Again, L 4°, Fig. 4, is made equal to L 4°, Fig. 2. Similarly the distance M 6°, N 8°, D 10°, Fig. 2, are transferred over to their respective positions in Fig. 4. It will be observed that the distances B 2°, L 4°, M 6°, etc., Fig. 4, are equal to the distances respectively A 1°, J 3°, F 5°, etc., in Fig. 3. Through these located points draw an even curve with the flexible wooden batten, as was done in Fig. 3.

It will be noticed that the rivet line 2 4 6 8 10, Fig. 2, is longer than the outline B L M N D. This extra length must be added on to the rivet line in Fig. 4. From the point G, through the centre of the quadrant M N D, draw the line G H. Measure from D to this intersection point on the quadrant, and transfer this distance over to Fig. 4, thus locating the line G H. From G', measured along the curve to 10, Fig. 2, transfer this distance to Fig. 4 by measuring from the line G H to $10^1$. Similarly, transfer the distance $G^1$ to 2, Fig. 2, over to Fig. 4 as from the line G H to $2^1$. Connect the points $2^1$ B $1^1$ and $10^1$ D $10^1$ each by suitable curves.

Fig. 4 shows the templet for the throat sheet, suitable laps to be added. The side sheets are developed in a slightly different manner. Transfer the outline of the side sheet as shown by 1 3 5 7 9 10 8 6 4 2, Fig. 2, to the similarly numbered outline in Fig. 5. Connect the points 1 P 2, 2 Q 4, 5 R 6, etc., Fig. 5, similar to Fig. 2. Measure off P 1″ and P 2″, Fig. 5, each equal to 1/6 of the circumference of which 2 $B^1$, Fig. 2, is the diameter, or measure along the semi-circle the distance 1° 2°, Fig. 2, and place half of this at each side of point P, Fig. 5, to locate the points 1″ and 2″.

Calculate or measure off half the distance along the arc of 3° to 4°, Fig. 2, and place this distance at each side of the centre Q on line 3 Q 4, thus locating $3^2$ and $4^2$ in Fig. 5. Again, take the length of the arc 5° 6°, Fig. 2, and place half of this on each side of R on the extended line $5^2$ R $6^2$ to locate the points $5^2$ and $6^2$, Fig. 5. Similarly transfer the distances 7° 8° and 9° 8°, Fig. 2, to their relative positions to locate the points $7^2$ $9^1$, and $8^2$ 10″. Connect the points 1″ $3^2$ $5^2$ $7^2$ $9^1$ and 2″ $4^2$ $6^2$ $8^2$ 10″, as shown in Fig. 5. Measure the length of the line 1 3 5 7 and 9 and also the line 1″ $3^2$ $5^2$ $7^2$ and $9^1$. Take half the distance between these two lengths and locate the points $9^2$ and $1^2$ by measuring from $9^1$ and 1″ respectively. Similarly measure to find out how much longer the line 2 4 6 8 10 is than the line 2″ $4^2$ $6^2$ $8^2$″. Take this difference and add half from 10″ to $10^2$ and half from 2″ to $2^2$. Connect $1^2$ to $2^2$ to locate the outline for the bottom of the side sheet.

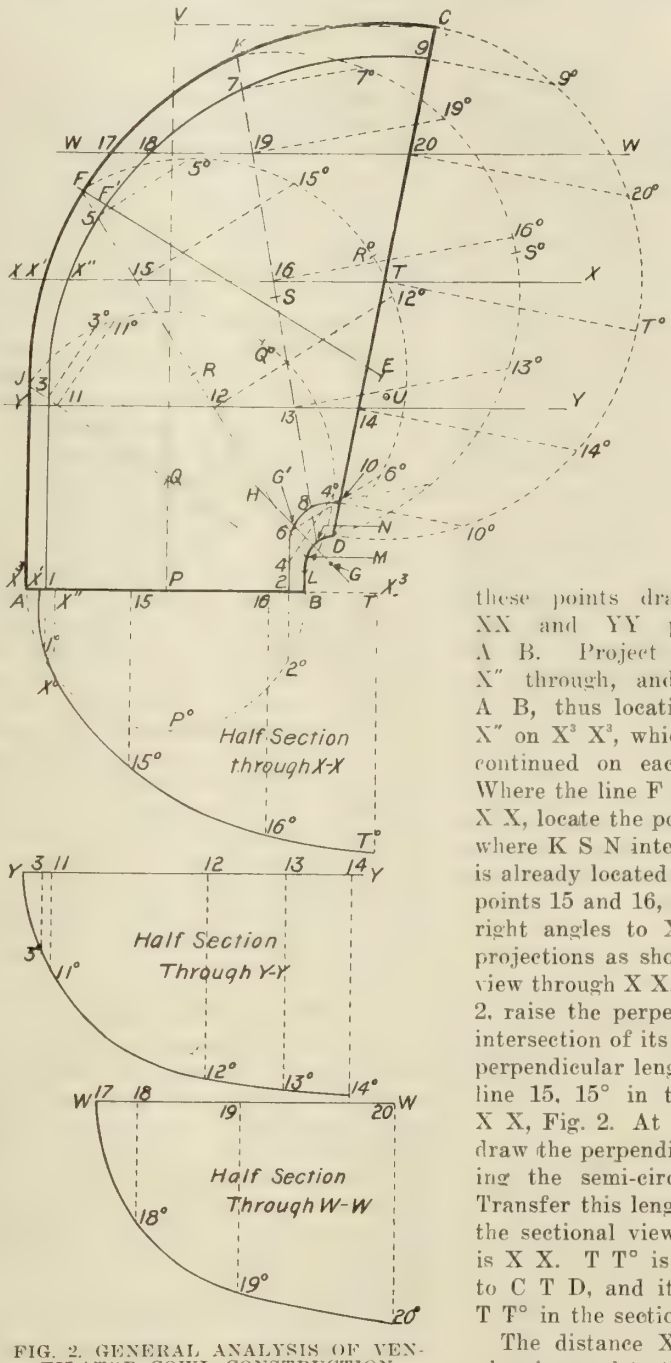

FIG. 2. GENERAL ANALYSIS OF VENTILATOR COWL CONSTRUCTION.

To obtain the curved line $9^2$ to $10^2$, it is necessary to find out the points W″ $T^1$ and Y″. This is done in the following manner: Divide C D, Fig. 2, into four equal parts, and through these points draw the planes W W XX and YY parallel to the line A B. Project the points $X^1$ and X″ through, and at right angles to A B, thus locating the points $X^1$ and X″ on $X^2$ $X^3$, which is shown on, and is continued on each side of A and B. Where the line F R M intersects the line X X, locate the point 15. Also locate 16 where K S N intersects the line X X. T is already located on X X. Project these points 15 and 16, and T, down to, and at right angles to $X^2$ $X^3$. Continue these projections as shown in the half section view through X X. On the elevation, Fig. 2, raise the perpendicular 15, 15° to its intersection of its arc F R° M. Take this perpendicular length and transfer to the line 15, 15° in the half-sectional view X X, Fig. 2. At right angles to K S N draw the perpendicular 16, 16° intersecting the semi-circle K S° N at 16°. Transfer this length 16, 16° to 16 16° in the sectional view for this plane, which is X X. T T° is drawn at right angles to C T D, and its length transfered to T T° in the sectional view.

The distance X″ X° in the sectional view is equal to the distance through X″ on the line X X in the elevation. This distance is not shown in the elevation view, but it is obtained by using a little judgment. The distance through the point 5 is equal to 5 5° and through the point 3 is equal to 3 3°, so if X″ was midway between the points 3 and 5, it would be equal to the mean of the two distances 3 3° and 5 5°. But X″ is nearer to 5 than 3, so it will be seen that it is not difficult to get the distance X″ X° for the cross-section. An even curve drawn

through the points T° 16° 15° 5° and X¹, in the section view, will define the half section for the plane X X.

The sections for Y Y and W W are constructed in a similar manner.

The plane lines W W, X X and Y Y in Fig. 2 are transferred over to their

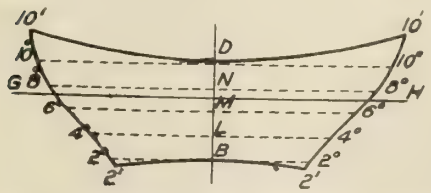

FIG. 4. TEMPLET FOR THROAT SHEET.

proper positions in Fig. 5. The distance X° 15° 16° and T° in the sectional view, Fig. 2, is equal to the curve of the side sheet; it is therefore transferred over to Fig. 5, measuring from the point X⁴ along the line X X to the point T¹. With the three points 9², T¹ and 10² located, the curve may be drawn in by a flexible batten. The points W″ and Y″ on this curve are located by taking the length of the curve 3° 11° 12° 13° and 14°, Fig. 2, and measuring this along the line Y Y, Fig. 5, from the point Y¹ to locate Y″. To locate W″, the distance 18° 19° and 20°, Fig. 2, is measured from W¹ along the line W W, Fig. 5. Five points are shown to locate the curve 9² W″ T¹ Y″ and 10² and, although three points would be quite sufficient, the number is left to the option of the reader. If three points are chosen it will be then only necessary to construct the cross sectional view through X X in Fig. 2.

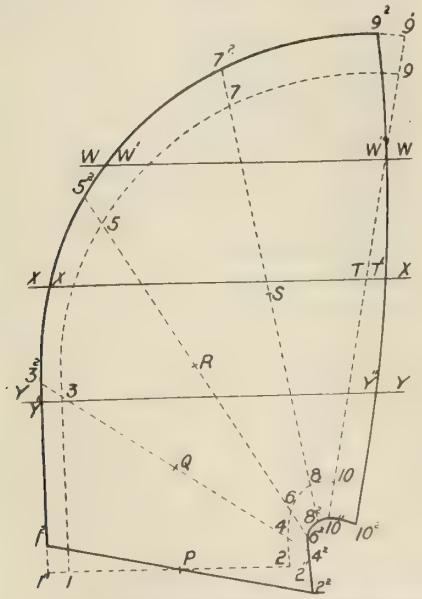

FIG. 5. DEVELOPMENT OF TEMPLETS FOR SIDE SHEETS.

The heavy lines in Fig. 5 show outline of the templet, minus the laps, for the side sheet.

Sets or gauges of the sections of the various planes will be used for trying out the templets, during the process of hollowing or blocking out.

The continuation of the cowl below the line A B is a straight cylinder and is developed as such. This cylindrical course is, of course, fitted inside the cowl for water-shed purposes, using the line A B as the girth seam line.

## COMMERCIAL TRAINING FOR STEEL PLANT MANAGERS.

IN a communication to the "Ironmonger," dealing with the commercial training of steel plant managers, E. Griffiths, M.I.Mech.E., Liverpool, England, says it is quite appropriate to advise British steel makers to modernise their plants so as to be able to reap the full advantage of the present opportunity of securing the world's markets, but the mere modernisation of plants is not sufficient, as commercial success must, after all, depend on the calibre of the men who run the plant.

The necessity of commercial training for engineers on the basis that to sell machinery successfully it is necessary for the salesman thoroughly to understand the product he is selling, applies equally, if not more imperatively, to the modern steel trade, where, by the introduction of small percentages of various alloys, the metal can be made adaptable to such varied uses. Therefore our steel works should be manned by a well-trained commercial technical staff, and controlled by men of initiative and ambition, who, to a sound basis training in engineering and the various branches of iron and steel manufacture, add a sound practical commercial and financial knowledge.

### Profitable Business Getting.

The success of a steel company does not lie in the possession of a fine plant or highly technical staff, as without business these cannot be profitably employed. The fundamental point in all trades is the making of profits, and in the atmosphere of a general meeting of shareholders, who know little, and care less, about the technicalities of the particular industry their money is invested in, it is of little use for a chairman to point out that the collieries are admirably equipped, the coal washeries up-to-date, or that the coke ovens are of the latest type, fitted with highly efficient sulphate and benzol plant, or that the coke burden of the blast furnaces has been decreased by use of desiccated blast, or that the latest mixed pressure turbines are used for blowing purposes, utilizing the exhaust steam from the mill engines, or that the open-hearth and Bessemer plants are second to none, unless he can at the same time announce a satisfactory dividend.

Now that the opportunity of securing a large proportion of the world's trade has unexpectedly arrived, there is no time to train such men; but would it not be possible to secure the services of men who have had a good technical training in steel works and engineering in their early days, and who have since branched out into commerce and learnt the art of technical salesmanship, together with the equally essential science of financing a business? Such men have the power to utilize their technical knowledge to its fullest advantage on the market, and, all things being equal, they are most likely to be able to make an otherwise satisfactory plant supply that one requirement of the modern shareholder—dividends.

## POWER OF WINDMILLS.

THE following table and other data compiled by the "Electric Review," show the horse-power which can theoretically be realized from a 28 ft. wheel exposed to winds of various velocities:

| Wind M.P.H. | Horse Power. |
|---|---|
| 2.25 | 0.04 |
| 6.7 | 1.1 |
| 11.2 | 5.0 |
| 15.7 | 13.0 |
| 22.5 | 409 |
| 33.5 | 351 |
| 45.0 | 205 |
| 67.0 | 1,080 |

The power available should increase with the cube of the wind velocity (since the kinetic energy of the air particles increases with the square of their velocity and the number of them striking the wheel blades per second increases in direct proportion to the wind velocity). It is not practicable to construct a mill which will use with equal efficiency a light breeze and a strong wind, hence the curvature and setting of the blades should be such that the mill works most efficiently when exposed to a wind of the velocity generally prevailing in the district.

Breezes of eight to 15 m.p.h. are much more common than 20 m.p.h., hence it is generally advisable to employ a very light wheel which will start work in a 3.5 m.p.h. wind, and which can still be used when the wind rises to 10 m.p.h. Such a wheel could not be exposed fully to a 30 m.p.h. wind and, for safety, a device should be mounted on the main wheel so that when the wind pressure exceeds a certain limit the inclination of the blades is changed, against the control of a spring, in such a manner as to reduce the effective area exposed to the wind. The control springs may conveniently be set so that they come into operation when the wind velocity exceeds 16 m.p.h.

# Series of Practical Questions and Answers for Mechanics

*Every care is being taken to include only pertinent, practical questions, and give same direct reliable answers. Catch questions will be avoided. Arithmetic, consisting of simple addition, subtraction, multiplication and division will be found a useful companion study.*

## AN ELEMENTARY STUDY OF RIVETED JOINTS.

RIVETING, at present, forms our only method of fastening steel plates together in the construction of steam boilers. The design of the riveted joint should be such as to secure the maximum aggregate strength. To accomplish this it should be equally strong in its several parts. That is, the shearing strength of the rivets should be equal to the tensile strength of the plate, and other possible methods of failure should be equally well balanced.

The rivets used in boiler work have, in general, two types of heads—the conical and round. The base of the former is usually made equal to twice the diameter of the rivet, and its height, three-quarters of the diameter. The base of the round head is made 1.7 times and the height 0.6 times the diameter. The distance from the centre of the rivet to the edge of the plate should be one and one-half times the rivet diameter, and the distance between centres of the rivets is known as the pitch.

Plates may be connected by lap joints or butt joints, and each may have one or several rows of rivets. A butt joint with a single cover plate should have the cover plate thickness equal to 1⅛ times the plate thickness. In the case of double butt straps, the thickness of each is made ⅝ of the thickness of the boiler shell. Longitudinal boiler seams are subjected to twice as great a stress as the ring seams, and hence have twice as many rows of rivets.

Riveted joints may fail in four separte ways: (1) The plate may fail in tension along the line of the rivets. (2) The rivets may fail by shearing. In the case of double cover plates this must take place at two points or the rivets are in double shear. (3) The rivet or the plate in front of the rivet may fail by crushing. (4) The plate in front of the rivet may shear out.

The **efficiency** of the joint is the strength of the joint compared to that of the unpunched plate. Thus, if the tensile strength of the plate is 64,000 pounds per square inch and a joint of ½-inch plate will stand 24,000 pounds per lineal inch, the efficiency of the joint is $\frac{24{,}000}{64{,}000} \times 2 = \frac{3}{4} = 75$ per cent.

This percentage can be greatly increased by increasing the pitch of the rivets and the number of rows.

**Question.**—What would be the shearing strength of a ¾-inch rivet?

**Answer.**—Cross sectional area of a ¾ rivet is $.75 \times .75 \times .7854 = .44179$ sq. inches.

Shearing strength of rivet steel is 50,000 pounds per square inch. Shearing strength of a ¾-inch rivet is then $.44179 \times 50{,}000 = 22{,}089$ pounds.

* * *

**Question.**—Using a safety factor of 6, and assuming the efficiency of the joint to be 65 per cent., what should be the thickness of a boiler shell plate for a boiler diameter of 54 inches and a steam pressure of 100 pounds per square inch?

**Answer.**—Total working pressure on one lineal inch of cross section is $54 \times 100 = 5{,}400$ pounds. This is resisted by two thicknesses of boiler plate. Ultimate tensile strength of boiler plate is 54,000 pounds per square inch. For a joint of 65 per cent. efficiency and a safety factor of 6, this becomes $\frac{54{,}000}{6} \times \frac{75}{100} = 6{,}750$ pounds per sq. in.

Load on a single thickness of plate 1 inch long $= \frac{5{,}400}{2} = 2{,}700$ pounds. Thickness of plate required $= \frac{27{,}000}{6{,}750} = .4$ inch, or, say, 7-16-inch plate.

* * *

**Question.**—What would be the approximate efficiency of a single riveted lap joint of good design, the pitch of the rivets being 4 inches and 1 inch rivets being used?

**Answer.**—It is assumed that the joint is equally strong in every way. The size of the hole punched in the plate will be 1 1-16 inch. In every 4 inches of length, 1 1-16 inch is punched out. Strength of plate after being punched is, therefore, 4—1 1-16.

$\frac{}{4}$ of the original plate.

Efficiency, then, is $\frac{2\ 15\text{-}16}{4} = \frac{2.9375}{4} =$ 73.4 per cent.

* * *

**Question.**—In the above example, if ⅝-inch plate be used, would the joint fail by shearing off the rivets or tearing off the plate?

**Answer.**—Tensile strength of boiler steel is 54,000 pounds per sq. inch. The length of plate supported by one rivet is 4—1 1-16 = 2 15-16 in.

Cross sectional area of this is $⅝ \times 2\ 15\text{-}16 = 1.835$ sq. in.

Total strength in tension $= 54{,}000 \times 1.875 = 101{,}250$ pounds.

Shearing strength of rivet steel = 50,000 pounds per sq. in. Shearing area of 1 inch rivet $= 1 \times 1 \times .7854 = .7854$ sq. in. Shearing strength of a 1 inch rivet is, therefore, $.7854 \times 50{,}000 = 39{,}270$ pounds.

The plating of the joint is then $\frac{101{,}250}{39{,}270} = 2.58$ times as strong as the riveting. The joint is not well designed.

* * *

**Question.**—In the above problem what would be the effect of triple riveting and increasing the pitch from 4 to 6 inches?

**Answer.**—The length of unpunched plate per rivet in the front row = 6—1 1-16 = 4 15-16 inch.

The cross sectional area of this is $4\ 15\text{-}16 \times ⅝ = 3.08$ sq. in., and its tensile strength is $3.08 \times 54{,}000 = 166{,}320$ pounds.

This amount of plate is sustained by three rivets, the shearing strength of which is $.7854 \times 3 \times 50{,}000 = 117{,}810$ pounds.

The joint is still $\frac{166{,}320}{117{,}810} = 1.41$ times as strong through the plate as through the rivets.

* * *

**Question.**—Two pieces fastened together by a 1 inch rivet are so loaded that the rivet is stressed in tension. If the rivet head be considered as strong as the body of the rivet and is conical in shape, will the rivet fail in tension or by shearing off the head?

**Answer.**—The height of the cone head would be ¾ inch, and its diameter at the base would be 2 inches. The thickness at the shearing point would be ⅜ inch. Shearing area then is $1 \times 3.1416 \times ⅜$.

Shearing strength $= 1 \times 3.1416 \times .375 \times 50{,}000 = 58{,}509$ pounds.

Tensile strength $= 1 \times 1 \times .7854 \times 54{,}000 = 42{,}411$ pounds.

The rivet then is approximately 40 per cent. stronger in tension than in shearing through the head.

# PROGRESS IN NEW EQUIPMENT

## A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

### WILLMARTH RADIAL DRILL.

THE Willmarth Tool Works, Cleveland, Ohio, are placing upon the market the radial drill illustrated herewith. The most prominent feature of this machine is in the manner of moving the head and arm for locating holes. The head rotates about a large circular bearing on the arm, and the arm rotates about the column as in the usual type. This produces a double-swiveling motion, so that any hole within the capacity of the machine may be readily located. A self-locking spiral gear and rack are provided for moving the head.

The bearing of the head on the arm is 17 ins. in diameter, and is provided with an annular ring inside for holding it central, and a heavy pivot bolt for holding the two together. A powerful eccentric clamp locks the head solidly to the arm, making substantially one piece. The column is of the post and sleeve type. The post has a large and heavy lower portion, and extends up to the top member, which is securely bolted to it, making a braced construction, and adding materially to the stiffness. The column sleeve telescopes the post, and has bearings both top and bottom, also a large ball thrust bearing at the bottom end, thereby rendering easy the swinging of the arm. The sleeve has a powerful binding clamp at its lower end which, when tightened, produces the effect of a solid column. The arm is very rigid, of cylindrical box section and heavily ribbed on the inside. It is elevated or lowered by means of gearing at the top through a coarse pitch screw, hung on ball bearings. There are eight changes of speed, from 35 to 375 r.p.m., arranged in geometrical progression. Four changes are obtained by the cone pulleys, and four more by the back gearing, which is provided in the spindle driving gears.

The tapping mechanism is obtained by a jack shaft in the head, running at high speed, and drives through powerful ring clutches, which are self adjusting, and which are operated by means of a lever in front of the machine, enabling the workman to easily start, stop or reverse the spindle. The spindle of special steel, is accurately ground and is provided with an ample ball thrust bearing. It has a No. 5 Morse taper hole, is 3¼ ins. in diameter at its large end and 1¾ ins. at its smallest section.

The feeding mechanism is composed of a selective gear box and its gearing, which drives a worm and worm gear, this in turn driving the feeding pinion. Six changes of feed are provided, ranging from .006 ins. to .027 ins per revolution of the spindle. These are instantly avoidable by operating the dial on the front of the feed box. A quick return hand wheel is attached to the feed pinion shaft, and the engagement of the worm to it is made by means of a friction ring controlled by a nut in front of the hand wheel. Both depth gauge and automatic trip are incorporated in the feed mechanism.

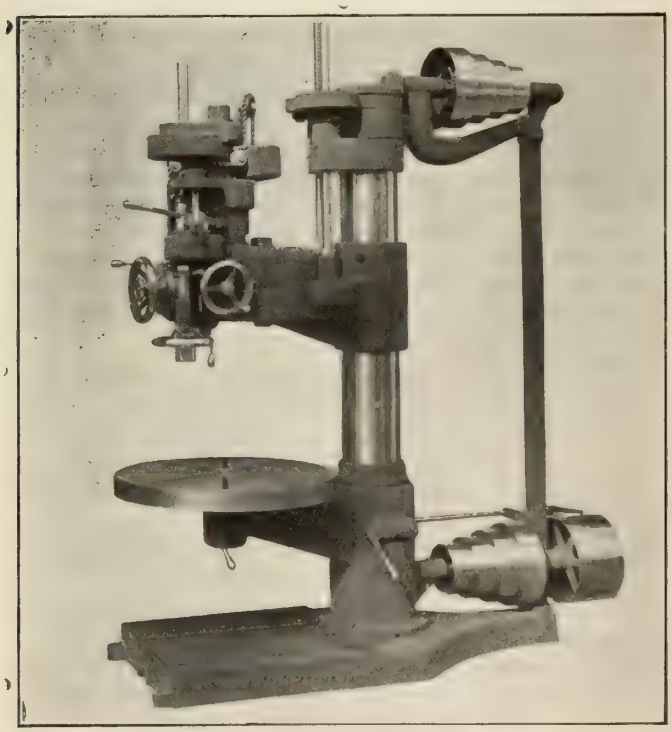
The bearings throughout are bushed with high grade special bearing bronze,, and great care is exercised to provide ample oiling facilities. No cast iron gears whatever are used in this machine, these being of steel, bronze or a specially high grade semi-steel. All gears are fully guarded. The machine is regularly provided with the round table shown, but can be supplied with any style desired on special order. The principal dimensions of the drill are as follows:—Drills to the centre of a 48¾ in. circle. Greatest distance from spindle to base is 52½ ins., and to table 27 ins.

Vertical traverse of spindle is 11¼ ins., and of arm on column 28 ins.

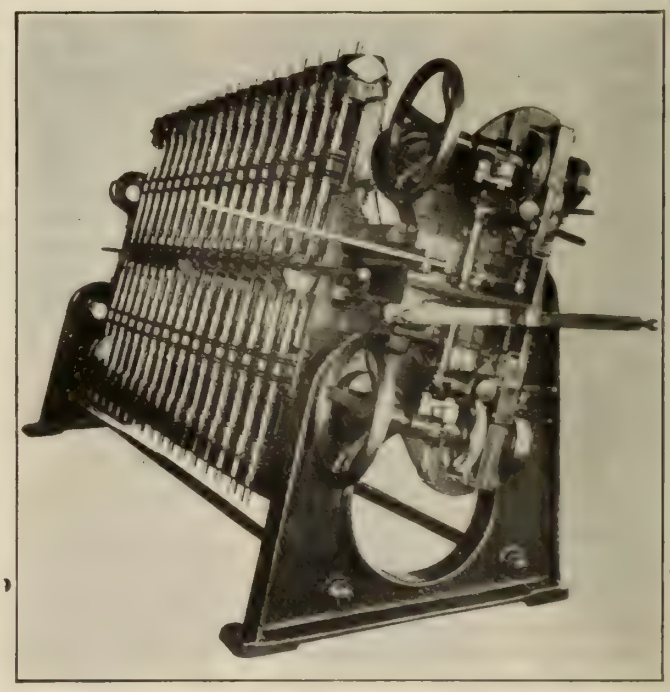
Height of machine is 96 ins., and weight 3,500 pounds.

### NEW TYPE GANG-DRILLING MACHINE.

A new type of gang-drilling machine has recently been designed by the Valley City Machine Works, Grand Rapids, Mich. The machines are especially intended for drilling holes in pipe, and drill the opposite walls at the same time. The method of driving can be readily seen.

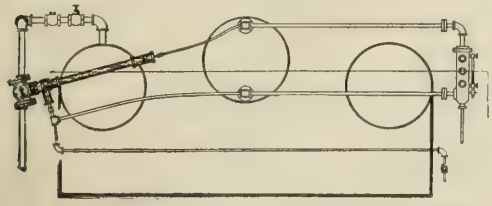


WILLMARTH RADIAL DRILL.



NEW TYPE GANG DRILLING MACHINE.

The machine consists essentially of a rail supported by as many legs as necessary. The rail carries the necessary units of drill spindle brackets which can be varied to suit the work. The rail is



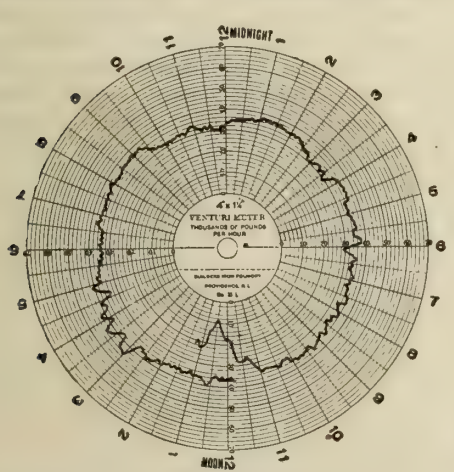
METHOD OF INSTALLING McDONOUGH FEED WATER REGULATOR.

set on an angle which enables the operator to handle the work with the least manual effort. The rail also carries the self-centering clamping jaws which are operated by the splined shaft, worm gears and rack and pinion. It will be seen that all spindles are adjustable both as to centre distance and drill lengths.

On the four spindle drill, which is twenty feet long, the feed is by hand lever at left end of machine, and on the thirty-four spindle drill, a power feed with automatic stop is provided for each gang of spindles. A sliding movement to the clamping jaws is imparted by the horizontal lever at right, by which the work can be moved longitudinally to different positions or stops for drilling any number of holes. The closest centre distance with clamps is 4¾ inches. The ten-foot machine weighs about six thousand pounds, and occupies a floor space of four by fourteen feet.

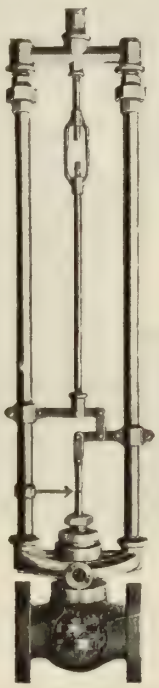
## AUTOMATIC FEED WATER REGULATOR.

THE automatic feed water regulator here described and illustrated, is manu-



VENTURI METER CHART SHOWING REGULATION OF FEED ON TWO BOILERS EQUIPPED WITH McDONOUGH REGULATORS.

factured by the McDonough Automatic Regulator Co., of Detroit, Mich. It is of the thermostatically controlled type, the main purpose of the design being to not only secure a continuous feed, but positive automatic control of same, so that the feed will vary with the boiler load and maintain a water level within limits best suited for constant boiler capacity, efficiency and uniformity of operating conditions. The regulator in operation it is claimed will maintain a continuous feed proportional to the evaporation, and for light and uniformly varying loads, a constant water level. On the other hand, for sudden increases of load and resulting rapid drop in water level, the regulator valve does not open suddenly to admit a large quantity of water into the boiler, there being a time element in



McDONOUGH FEED WATER REGULATOR COMPLETE.

the expansion of the tubes operating the valve which uniformly increases the feed, permitting the immediate furnace heat to be used for evaporating water and not heating cold feed. In this way the maximum capacity of the boiler, with greater uniformity of furnace conditions is maintained and boiler strains are avoided.

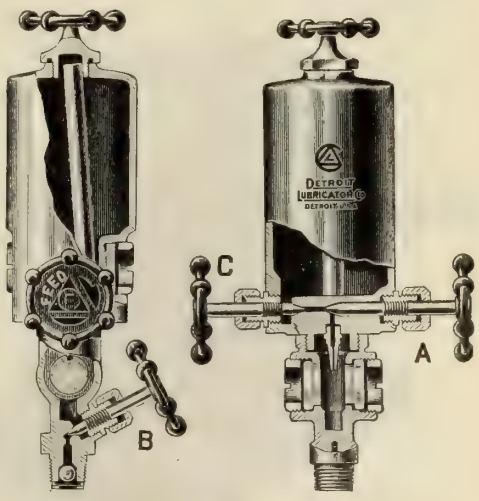
The regulator consists of a special feed valve, two headers and two expansion tubes connected in parallel through a rigid linkage to the feed valve stem. The use of two expansion tubes doubles the power of expansion and contraction and the levers transmit the motion to the feed valve in a ratio of 5 to 1. The turnbuckle and pointer indicator permit very accurate adjustment of the valve and further, the pointer indicator shows at each instant the position of the valve while the regulator is in operation. The regulator is installed in an inclined position, wholly supported by the feed piping and with the connections made to the water column as shown. In operation, the lower ends of the tubes are filled with water and the upper with steam. As the water falls or rises in the boiler, it correspondingly falls or rises in the regulator tubes, presenting a greater or less area of the tube surface to the hot steam, causing them to expand and contract accordingly. The inclined position of the regulator gives the greatest variation in exposed tube surface for a given variation in water level and the greatest sensitiveness to variations in load.

The accompanying Venturi meter chart, taken on two boilers equipped with McDonough automatic regulators at the plant of the Quaker Oats Co., Akron, Ohio, indicates the uniform and constant feeding characterists of this apparatus which goes under the trade name of the "World's Best."

## AMMONIA CYLINDER LUBRICATOR.

THE Detroit "600" Lubricator, which is manufactured by the Canadian Detroit Lubricator Co. of Walkerville, Ont., is designed and constructed especially for use on ammonia cylinders. It may be attached to the ammonia cylinder or to the pipe line leading to same. Lubricators for steam or air cylinders are constructed of brass, but lubricators constructed entirely of brass are not satisfactory on ammonia cylinders because of the excessive corrosion, consequently the "600" Detroit is constructed of material that will resist the action of the ammonia fumes. This lubricator is easily operated, and gives constant lubrication to the cylinder under every condition of service.

The lubricator is substantially made so as to withstand excessive pressures, vibration and rough usage. It has bulls-



DETROIT AMMONIA LUBRICATOR.

eye sight feed and gauge glasses which are easily kept tight and not readily broken. The filler plug and valves are provided with metal handles.

The lubricator may be connected di-

rect to the cylinder, and using, if desired, a short piece of pipe and elbow. No separate valve is used, as the valve B in the support post cuts off the lubricator from the cylinder when it is desired to repack the glasses, clean the

DETROIT AMMONIA LUBRICATOR.

lubricator, etc. The valve C controls the admission of oil to the oil passages, and should be used to operate the lubricator, making it unnecessary to change the adjustment of valve A, which need not be disturbed after once being properly regulated.

## LARGE SLIP-RING INDUCTION MOTORS.

THE Westinghouse Electric & Mfg. Co. has recently placed on the market a new line of large slip-ring induction motors for continuous service, such as driving pumps, blowers, compressors, hoists and other machinery requiring heavy starting torque.

One of the chief characteristics of these motors is great strength. The

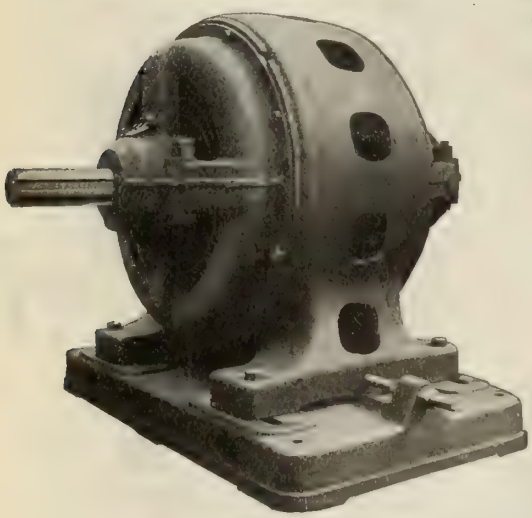


FIG. 1—NEW SLIP RING INDUCTION MOTOR.

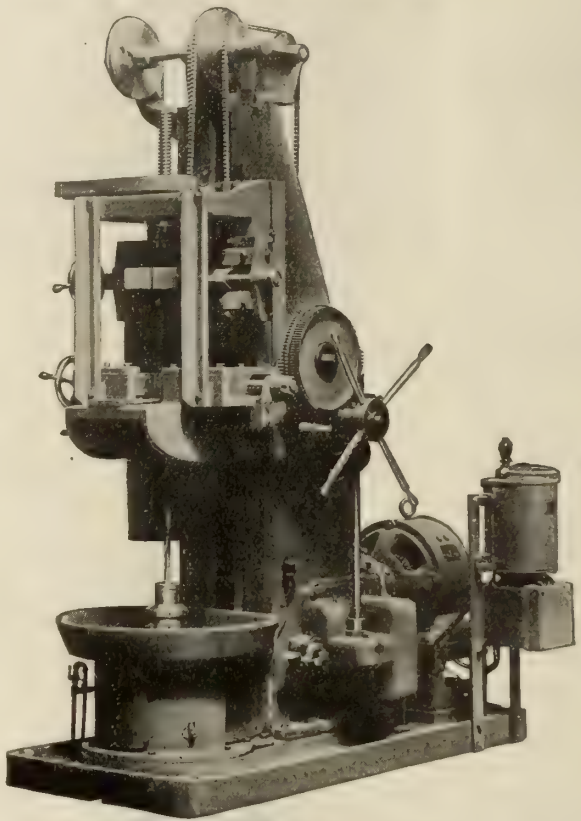
frame is massive, the bearings and shaft extra large, and the windings are securely braced against vibration. The bearings are dustproof and rest on three machined seats, a construction that has been found to be the best practice in steel mill service.

All coils are form wound and completely insulated to ground before being placed in the slots. The stator slots are straight open; those of the rotor have an overhanging lip which assists in holding the coils in place, but the coils can be removed and replaced without bending as readily as with straight open slots. The shaft can be removed without disturbing the rotor winding.

The bearing shell may be removed and replaced without taking off the lower



INVERTED TYPE DRILLING MACHINE.

FIG. 2—NEW SLIP RING INDUCTION MOTOR.

half of the bearing bracket. The brushes are readily accessible, as may be seen in Fig. 2.

## AN INVERTED DRILL.

THE interesting feature of the drill shown in the illustration is that it drills from the bottom upwards instead of vice versa, which is the usual practice. This machine is designed for drilling 90 point carbon billets, 20 inches long and 4 or 5 inches in diameter. The advantage of drilling them in an inverted position is that the driving spindle is held rigid at the bottom of the machine and vibration is reduced to a minimum on the drill which is of small size and 24 inches long.

The head of the drill is really a jig for holding the pieces, and two sets of jaws are provided to grip the upper and lower parts of the billet and insure centering. There is also a jack-screw for holding the billet in place.

The machine is manufactured by the Foote-Burt Co., Cleveland, Ohio, and is driven by an 8½ h.p. Westinghouse Electric Co. direct-current adjustable speed motor, 800 to 1,600 r.p.m. controlled by a Westinghouse drum controller.

## TRANSMISSION LINE INSULATORS.

THE color of insulators for transmission lines is important. Most engineers prefer brown, green, or neutral tints as beiess conspicuous than white, and therefore less likely to attract the attention of stone throwers, etc. White insulators have, however, the advantage of more readily disclosing where a breakdown has occurred. On lines comprising two or more circuits it is sometimes advantageous to use insulators of different colors for each circuit in order to prevent mistakes and danger to linesmen.

All insulators should be made of the highest grade porcelain which has been vitrified throughout, and is absolutely non-absorbent of moisture and free from flaws, cracks, or foreign matter. The coloring of insulators is given by the glaze, which must cover the entire surface, except the area where joints are made, and must be free from crazing, bubbles, cracks, etc. On completion, insulators should be tested both electrically and mechanically.

**Hugh Davidson**, of Goderich, Ont., has been appointed captain of the steamer Meaford. Mr. Davidson is 25 years of age, and one of the youngest captains on the Great Lakes.

## SHIPBUILDING A NATIONAL ASSET.

THE world's shipbuilding and marine engineering output statistics recently available for the year 1914 form as usual both interesting and highly instructive reading, and we as Canadians should no longer be content to occupy the somewhat lowly place that the year after year figures of our production allocate to us. This twin industry is one which we have in the past almost wholly ignored, much less appreciated. We have become so accustomed to put all of our eggs into the one basket that any other began to appear wholly unnecessary, and to-day when shipbuilding and marine engineering are booming, and shipowners and Governments are making frantic efforts to add to their ocean fleets, we are caring for our unemployed by providing emergency works.

Setting aside the fact of her insular location, one prominent feature in Britain's business life has been so to establish and develop every known department of enterprise as to be able to give an equivalent return either in kind or service to those on whom she in numerous instances has had to be or is dependent. In the realm of shipbuilding and marine engineering, although at one and the same time a "Past and Present Grand Master," she has neither overlooked nor neglected other spheres of manufacturing or, more strictly speaking, other mechanical engineering enterprise, being in these respects at least a competitor worthy of the keenest.

We in Canada are more insular in our business attitude than is Britain in her geographical location, and too often lose sight of the fact that to give the world what it wants and needs we should be in a position to not only produce and manufacture, but produce, manufacture and own the vessel transportation to deliver. Our crops are no doubt quite a substantial asset and, just because we have so chosen to make them, are of considerable importance to us nationally, but we are familiar enough with the fickleness of our climate, or should be so to realize, that crop failures are not uncommon. We have not hesitated to cater to railroad transportation nor to establish industries bearing on the latter, yet how little have we done to establish or stimulate water transportation industries within our borders or on our seaboards.

Our mineral wealth, it is authoritatively stated, is so unbounded that developments which have already taken place may be classed as mere surface scratches. There still lies hidden, we are told, across the length and breadth of this Dominion, the raw material with which we may yet become a first-ranker in the manufacturing world. We have chosen in the past, however, to stake our very existence on our crops, and have conformed our manufactures to that end. We have saddled and burdened our country with two transcontinental railroads whose revenues will not meet expenses in the next 25 years, or perhaps longer, unless we come to our senses soon, when proper regulation of the original railroad and its spur development would have sufficed. Had a fraction of the expenditure on these fool-hardy enterprises been given to the establishment and stimulating of shipbuilding and marine engineering with their myriad accessory industries, there would have been fewer iron and steel plants idle and semi-idle to-day and less unemployment of men and equipment.

It is highly significant of the ensuing navigation season outlook, that the Lake Carriers' Association at their recent annual meeting decided to delay the start of their vessel operations until June 1, and it is equally significant of the undesirable position in which the United States finds itself to-day that, at least so far as its Government is concerned, it is out "flat-footed" to purchase all available vessels to build up its merchant marine. It has required this European War to bring home to that otherwise progressive country the fact that an outlet of their own is absolutely necessary to meet both ordinary and extraordinary contingencies.

Canada owes equally as much to steamships as to railroads for her development, although in recent years her Government and her citizens have forgotten the fact. Her shipbuilding too was once a factor in the world's commerce, but was engulfed when railroads and wheat became enthroned.

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

**Montreal, Que., Jan. 25, 1915**—During the past week the volume of business moving has not shown any great increase over that of the week previous. This is, of course, due largely to the dull times which are always present at this season. There seems to be normal activity in the general lines of trade, although the railways are not purchasing as heavily as had been expected. The number of inquiries continue to increase and the amount of actual business being placed is also developing. The increasing number of inquiries goes to show that there is under consideration a certain volume of business which will be placed early in the spring.

The incessant demand for shells and war munitions has created a great deal of activity in those shops whose equipments enable them to handle such work economically. Further, the demand for turret lathes, grinders and other small machines used in their manufacture, has stimulated machine tool sales.

The pig iron markets remain rather dull, but in the metal market a marked activity prevails. A general stiffening in prices is noted, copper being particularly active.

The building trade will soon be in the market again for steel to enable firms to commence work on their spring contracts, while orders for steel forgings for war munitions and marine purposes are finding their way to Canadian firms more frequently of late.

### The Steel Market

Although it was expected that the railways in the Central and Eastern States would place more or less extensive orders with the steel companies early in the year, such has not been the case. It is true, however, that they have placed a number of orders but these have not been as large as was expected. Canadian mills are receiving considerable business from Britain and have been kept busy filling same. The general situation has not changed since last week.

### Pig Iron.

This branch of the trade remains very dull indeed and there seems very little prospect of early improvement. The

price still continues very low indeed. Virginia furnaces have booked orders for several hundred tons at $12.50 for No. 2 grade. However, in and around Buffalo, prices vary from $13 to $13.50 for delivery in the second quarter of 1915.

### Machine Tools

This particular department remains exceedingly quiet on account largely of the reduction in all lines of manufacturing. The nature of the orders has changed from those in bulk to individual, the largest demands of the latter being for turret lathes and grinding machines. The supply business continues about the same.

### Metals.

In the metal market considerable activity has been experienced during the past week. Everywhere prices have risen. It is, however, difficult to trace the reason for the advance in copper, but it is due, no doubt, to increased demand for metal. Evidently there will be no curtailment in the amount of shipping to Europe. Spelter also took a rise of one cent per pound, as also did tin. Throughout the whole metal market the tendency is for the price to stiffen. Regarding antimony, it is very necessary to emphasize the remarks of last week, supplies from Europe being unobtainable, while Russian interests have almost wholly monopolized the Japanese and Chinese output. Aluminum and lead are the least active of the metals, and although the prices have not changed, there is a marked tendency to stiffen.

---

**Toronto, Ont., Jan. 26, 1915.**—There has been little, if any, improvement in business this week, conditions generally being unchanged, with few indications of any substantial improvement in the immediate future. The situation, however, is not much below normal and is capable of quick recovery as soon as the outlook improves sufficiently to warrant a more progressive policy. Manufacturers are continuing their policy of retrenchment and the railways are restricting their operations. The latest Government contract for uniforms amounts to about four million dollars which, in addition to previous orders, is keeping a number of factories busy. There has been some development in the steel trade with regard to war orders but not sufficient to create much enthusiasm over the prospects of that industry. The Dominion Government returns show a decrease of twenty-two millions of dollars in the value of imports for December; on the other hand, there was an increase in the same month of two million dollars in the exports of manufactured goods. The balance of trade against Canada is gradually decreasing, December exports being six million dollars greater than the imports. This is a favorable feature, but would be more so if business were normal. There has been no decision handed down yet with regard to the proposed increase in freight rates and the tariff situation continues to be a subject of considerable interest among business people.

Conditions in the steel trade are much the same as last week; the volume of business is comparatively light, although orders for war materials are keeping some mills more or less busy. An adjustment has been made in the price for wrought iron pipe, the discounts being slightly higher. The scrap metal market is dull and prices unchanged; the same may be said of pig iron. There is a little better tone in the metal markets, copper, tin and spelter having advanced in price. There is considerable activity in machine tool circles on account of increased business in equipment for machining shrapnel shells.

**CO-OPERATIVE—NOT COMPETITIVE.**

**In his thesis on "German Methods in Commerce," issued by the Institute of Industry and Commerce, Sir William Ramsay, after urging strenuous war upon such methods, says that "Once the conquest is achieved, we should do well to remember that commerce should be co-operative, and not competitive; it being to our interest not only that we ourselves should prosper, but that others should also prosper; that, indeed, our own prosperity is bound up in the prosperity of our fellow creatures."**

### Steel Trade.

There is little of importance to note in the iron and steel trade and conditions are generally quiet; not unusual at this time of the year. The building trade is as dull as ever and consequently there is little demand for structural shapes. There has been a little better demand for bar iron from manufacturing interests. A considerable amount of steel is being used in the manufacture of shell cases, and the demand continues to increase. There have been no price changes this week.

The steel trade in the States is showing greater activity, having somewhat improved since the beginning of the year. Mill operations show a gain this year of approximately 55 per cent. in the Pittsburgh district. The ferro-manganese situation is becoming more complicated on account of the action of the British Government in seeking to prevent the shipment from the States, except through London, of this alloy, or any products in which it might enter, to Germany or Austria. This applies to ferro-manganese originating from Great Britain. Prices are firm but unchanged, except billets, which have advanced slightly.

There has been a re-adjustment in the discounts of wrought iron pipe which will be found in our market quotations. The discounts which have recently gone into effect are from 1 to 3 per cent. higher. It is anticipated that there will be a further adjustment in prices on account of a possible change in the customs tariff. The new discounts, however, are in effect until further notice.

### Pig Iron.

The market is quiet and uninteresting. The demand has improved somewhat, but buying still is light. Prices are unchanged.

### Machine Tools.

The number of machine shops working on shell orders continues to increase and there is still considerable activity in machine tool circles. Local machinery houses are busy figuring on inquiries for equipments and some nice business has been booked with more in prospect. The situation is interesting and apparently will continue to be so for some time.

### Supplies.

The demand for machine shop supplies is steady but light, with no change in prices except linseed oil, which has advanced 4 cents, the price of raw oil being now 68 cents and boiled 71 cents per gallon. The advance is accounted for by the high price of flax seed, and although the demand is light a further advance is anticipated shortly. Leather belting has not changed although a continued shortage of hides and heavy demand for leather is reported.

### Metals.

Locally the demand for metals is light, but gradually improving. Prices in some cases are higher on account of strength in the primary market. Copper has advanced ¾c per pound, the strength of the market being attributed to the demand from Europe. Lake copper is being quoted at 15c per pound. The demand for tin is light but the market is firm and prices higher in London. The price locally has advanced ½c and tin is now being quoted at 36½c per pound. The spelter market is strong and prices continue on the up grade; heavy exports to London and improved domestic demand in the States are tending to stiffen the market. Spelter has

advanced ¾c. being now quoted at 7c per pound. The antimony market is strong on good demand but prices are unchanged at 18c per pound. Aluminum is unchanged at 22c per pound.

### FREIGHT BILL SCRUTINY.

CANADIAN consignees in the district east of Port Arthur are advised by the Traffic Department of the Toronto Board of Trade to scrutinize their bills for freight shipped from points in the United States east of Buffalo and north of the Potomac River.

Under the decision of the Interstate Commerce Commission given on Dec. 16, 1914, in the "five per cent. case," railways in official classification territory, roughly speaking, east of Buffalo and north of the Potomac River, were allowed to increase their freight rates. The new rates were made effective from January 15, 1915, and by the tariffs of interested lines were extended to Canadian points east of Port Arthur. Supplements to those tariffs, however, were issued, postponing the advance, in so far as Canadian points were concerned, until February 15.

It appears, nevertheless, possibly through some misunderstanding, that the billing clerks of some of the American trunk lines have billed shipments to Toronto and other Canadian points at the increased rates. The Traffic Department of the Board of Trade, therefore, cautions consignees to examine their freight bills for shipments from the territory affected, and if overcharged to file claims for refunds.

### WHEN THE WAR IS OVER.

WHEN the war is over we hope, says the Engineering Review, that some attempt will be made to give a comprehensive account of the part which British manufacturing power has played in the prosecution of defensive and offensive operations. If money is the sinews of war, engineering is the bone and muscle. This immense productive activity, however, has its dangers. It is apt to obscure the thought of what will happen when the military demand ceases as rapidly as it came into existence. That will be the really critical period; and now is the time when provision should be made for it.

Lloyd George has stated that the post-bellum period, when the world is suffering from the exhaustion of capital on the unproductive business of war, will bring the most serious industrial situation which this country has ever been called upon to face. In this statement he may be expressing a more gloomy view than most of us are inclined to share. Nevertheless, it is only everyday wisdom, in manufacturing as well as in military matters, to prepare for the worst that may happen. Our industries must, therefore, find time to consider, even in the midst of the rush of war orders, what is going to happen during the reaction after the war, and how they are going to deal with it.

## Canadian Commercial Intelligence Service

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

# INDUSTRIAL AND CONSTRUCTION NEWS

**Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.**

## Engineering

**Toronto, Ont.**—The Polson's Iron-works will build an extension to the machine shop.

**Wallaceburg, Ont.**—The pumps of the waterworks system were successfully used for the first time on Jan. 20.

**Berlin, Ont.**—The Regal Automobile Co. propose to build an extension to their factory here. Mr. Nyberg is manager .

**Fort William, Ont.**—The Northern Engineering Co. are negotiating for a large order of shells from the Government. W. J. Ross is the manager.

**Mount Brydges, Ont.**—The village trustees have decided to take steps for fire protection. Underground concrete tanks will be built and electrically driven pumps installed.

**Toronto, Ont.**—Mayor Church informed the Board of Control on January 19 that the Exhibition Board had plans ready for a new machinery hall for the Exhibition grounds, and would ask an appropriation of $105,000.

**Thorold, Ont.**—The Exolon Company, makers of an artificial abrasive, propose to build another unit to their plant, to cost $20,000. The present buildings and equipment represent an expenditure of $130,000. C. J. Brockbank is manager.

**Midland, Ont.**—The steel plant formerly known as the Georgian Bay Engineering Works, which has been standing idle for nearly fifteen months, will resume operations. Drummond Brothers have leased the plant, and will fit it up for the manufacture of shrapnel shells. J. J. Drummond is manager of the company.

**Chatham, Ont.**—The City Council is negotiating with the Augustine Automatic Rotary Engine Co. for the sale of the Defiance plant on Lacroix Street. The company has made an offer to the Council, which has been endorsed by the Board of Trade, and the entire matter has been placed in the hands of the industrial committee.

**Fort William, Ont.**—The National Tube Co. is making application for the return of one-half of their deposit of $50,000 with the city, on the ground that they have carried out the terms of their agreement by spending the required amount of money on the plant and putting it in operation, though only for a week. The balance of the money is to be returned to them on their completing a full year's operation.

## Electrical

**Hamilton, Ont.**—E. T. Sifton, chief Hydro engineer, is now preparing plans and estimates of the cost of introducing a municipal telephone system, which will include the Hydro, the Board of Education and Works Department, and other civic departments.

**Lucan, Ont.**—Hydro was turned on here on Jan. 22, and following the interesting ceremony, a large public meeting was held in Stanley's opera house, where addresses were heard from Engineers Kaster and Jeffrey, of the Ontario Hydro-Electric Commission.

**St. Thomas, Ont.**—The work of erecting an extension to the Hydro-Electric power station, north of here, as a substation in connection with the electrification of the London & Port Stanley Railway, has been commenced. The extension will be 44 x 72 feet. Hyatt Bros., of London, have the contract.

**Toronto, Ont.**—Huntsville has passed all the necessary by-laws for a Hydro plant on the Muskoka River, and the agitation is causing a stir in Bracebridge, which has had a local system for some time, but where a by-law to augment the power facilities was defeated recently.

## General Industrial

**Kincardine, Ont.**—The by-law passed last Friday to authorize a loan of $15,000 to the W. Mitchell Co. knitting factory.

**Indian Head, Sask.**—The elevator of the Winnipeg Elevator Co. here was burned to the ground on Jan. 22. It is a total loss, together with 30,000 bushels of grain.

**Galt, Ont.**—Messrs. Lamers and J. A. Parsons, of the Vogue Hat Co., Montreal, have been here looking for a location to establish a factory to manufacture fur, felt and straw hats.

**Redcliff, Alta.**—It is reported that Mr. McHenry proposes establishing a grist mill and elevator in Redcliff. Plans and specifications have been prepared for a 200-barrel mill to cost in the neighborhood of $20,000.

**Sherbrooke, Que.**—The Board of Trade is negotiating with a firm in the United States who propose establishing in Sherbrooke a factory for making silk hosiery, gloves, etc. An agreement has been signed by both the city and the company.

**Camrose, Alta.**—W. Mortimer has decided to install a flour mill in the New Norway district. The machinery is already on the way, and it is expected that the mill will be in operation soon. The plant will be of 40-barrel per day capacity.

**Hamilton, Ont.**—Industrial Commissioner Marsh, in his annual report to the Board of Control, announced that the prospects for securing new industries for Hamilton were particularly bright. He had negotiations under way with ten concerns which had about decided to establish branches.

## Municipal

**Sarnia, Ont.**—The village of Point Edward, near here, will buy fire-fighting apparatus.

**Brandon, Man.**—The council are in the market for new equipment for the fire department.

**Ottawa, Ont.**—A by-law has been approved in connection with the proposed civic abattoir to cost $100,000.

**Kenora, Ont.**—T. Aird Murray, consulting engineer, Toronto, has the work in hand for the proposed sewage disposal plant.

**St. Catharines, Ont.**—The City Council are considering the installation of an incinerator plant. W. P. Near is the engineer.

**Hamilton, Ont.**—Chief Ten Eyck, in his annual report of the fire department, recommends the installation of an entire new fire alarm system, and that ten new alarm boxes should be installed at once.

**Regina, Sask.**—The City Commissioners have recommended the purchase of a low tension switchboard for the new power house. The tender of $747 submitted by the Mainer Electric Co., of this city, will probably be accepted.

THE A. R. WILLIAMS MACHINERY CO., LTD
ST. JOHN, N.B. TORONTO WINNIPEG VANCOUVER

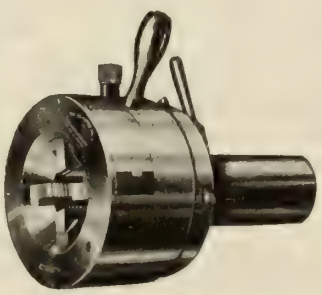
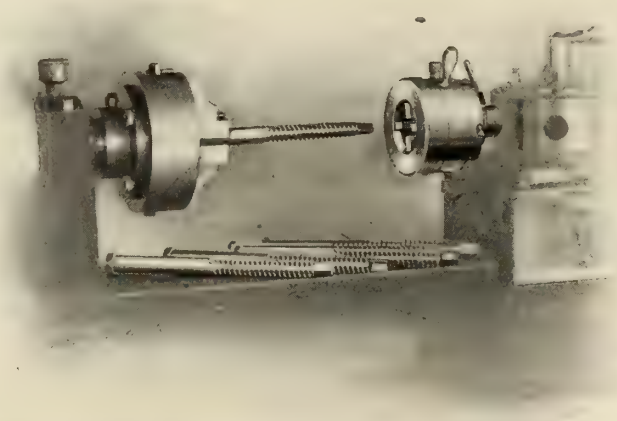
## The Geometric Tool Company

**New Haven, Conn.**

Canadian Agents: Williams & Wilson, Montreal; The A. R. Williams Machinery Co., Toronto, Winnipeg and St. John, N.B.





Geometric Style "D" Self-Opening and Adjustable Die Head, cutting Acme threads on a standard turret lathe.

**Aylmer, Que.** — The ratepayers on January 19 voted down the by-law to install a filtration plant, but carried the by-law to extend the intake pipe.

**Point Grey, B.C.**—The Council have authorized the acceptance of delivery of the new steam pump for the fire department. The engine will cost $12,200.

**North Bay, Ont.**—At a meeting of the Town Council it was decided to submit a by-law to the electors to raise $60,000 for road and street improvements during 1915.

**Kingston, Ont.**—Hugh McBratney was elected chairman of the Kingston Board of Health on January 21. The board is considering the installation of an incinerator for garbage disposal.

**London, Ont.**—The village of Ilderton, 10 miles north of here, decided to join the Hydro-Electric Union on Jan. 25, by carrying a hydro-enabling by-law by a majority of 22. A small vote was cast.

**Hamilton, Ont.**—The National Gas Co., which under its agreement with the city was to have laid seven miles of pipe last year, and laid but three and a half miles, according to the city inspector's report, will be asked to appear before the board and state why they failed to fulfil their agreement.

**Brockville, Ont.**—On the recommendation of the district medical officer of health, the provincial sanitary engineer, F. A. Dallyn, Toronto, has been requested to visit Brockville to make a report on the town's water supply, which is thought to be the cause of the outbreak of typhoid fever.

**Ottawa, Ont.**—The council will submit the amended report of the Board of Trade to the Provincial Board of Health. The report proposes the construction of an overland pipe to Lemieux Island to increase the water supply, as shown on a plan of J. B. MacRae, engineer. All reference to filtration was eliminated.

**Aylmer, Que.**—The solution of the water question is still in doubt. Although the people passed the by-law for the extension of the intake pipe, the Provincial Board of Health has on several occasions stated that they would not accept this as a solution of the water problem. It is expected that the Board of Health will order the town to install a filtration plant.

**Goderich, Ont.**—The town is having trouble with its water supply again. The water supply is taken from the lake, and the difficulty has been to get the water pure and free from sewage contamination. The intake crib has been changed several times, and the pipes extended further out in the lake at a great expense to the town, and now another change, estimated to cost about $38,000, is being agitated.

**Winnipeg, Man.**—At a meeting of the Transcona council on Jan. 21, the agreement between the town and J. H. Kern, Sr., of Moose Jaw, relative to the building of an electric line from Winnipeg to the town was annulled, and E. Baily Fisher was appointed to bring the matter before the attention of Public Utilities Commissioner Robson for his official sanction. The agreement to build the line was entered into last summer, but it is understood that it is impossible to finance the project at the present time.

## New Incorporations

**Perham & Co.** has been incorporated at Ottawa, Ont., with a capital of $50,000 to operate stone quarries, etc., at Montreal, Que. Incorporators: E. D. Maguire, D. F. Carter and R. E. O'Neil, all of Montreal, Que.

**The Wiarton Woolen and Knitting Mills, Ltd.**, have been incorporated at Toronto with a capital of $50,000 to manufacture woolen goods at Wiarton, Ont. Provisional directors include T. H. Barton and C. B. Anderson.

**Leather Canvas Textile Mfg. Co.** has been incorporated at Ottawa, Ont., with a capital of $50,000 to manufacture leather and canvas goods at Ottawa, Ont. Incorporators: R. G. Code, E. F. Burritt and J. R. Osborne, all of Ottawa, Ont.

**Ingersoll Machine Co.** has been incorporated at Ottawa, Ont., with a capital of $40,000 to carry on the business of electrical and mechanical engineers at Ingersoll, Ont. Incorporators: L. A. David, L. E. D. Mailhiot and S. H. R. Bush, all of Montreal, Que.

**The Auto Heater Co.** has been incorporated at Toronto, Ont., with a capital of $50,000 to manufacture automobile heaters and heaters for public or private conveyances at Toronto, Ont. Incorporators: J. R. L. Starr, Grant Cooer and R. P. Locke, all of Toronto, Ont.

**Webster Construction Co.** has been incorporated at Toronto, Ont., with a capital of $40,000 to carry on business as contractors and engineers at London, Ont. Incorporators: W. G. Webster, J. E. Skallman and A. B. Webster, all of London, Ont.

**Winnipeg Aqueduct Construction Co.** has been incorporated at Ottawa, Ont., with a capital of $250,000, to take over the Northern Construction Co; and the Carter Halls-Aldinger Co., also certain contracts entered into by the two companies with the Greater Winnipeg Water District relating to the construction of an aqueduct for the said district. Incorporators—C. V. Cummings, F. E. Halls and Wm. H. Carter, all of Winnipeg, Man.

## Tenders

**Toronto, Ont.**—The Canadian Electrical Association are in the market for large quantities of lamps, transformers, meters and wire. For specifications and forms of tender, etc., apply to Alan Sullivan, sec.-treasurer, 10 Adelaide Street East.

**Toronto, Ont.**—William R. Perrin & Co., 530 King street east, makers of abattoir equipment are selling their plant and buildings. Tenders will be received up to Feb. 3. Full particulars may be obtained from E. R. C. Clarkson & Sons, Toronto.

**Calgary, Alta.**—Tenders will be received up to February 12, 1915, for the furnishings and erecting of steel superstructure for Louise Bridge at 9th St. West. Plans, specifications and information may be obtained from the city engineer's office, upon making a deposit of $5.

**Toronto, Ont.**—Tenders will be received at this department until Monday, February 1, 1915, for the electric fixtures required for new Government House, Rosedale, Toronto. Plans and specifications can be seen at this department. H. F. MacNaughten, secretary, Public Works Department.

**Toronto, Ont.** — Tenders will be received by the chairman of the Board of Control, City Hall, up to Tuesday, Feb. 2, 1915, for the supply of cast iron special castings. Specifications and tender form for the foregoing may be obtained upon application at Room 12, purchasing and accounting section, of the Department of Works, City Hall.

**Toronto, Ont.**—Tenders will be reeceived up to Tuesday, February 2, 1915, for the supply and delivery to the Street Cleaning Department of 100 (more or less) loose paper can receptacles, as may be required. Specifications may be seen and form of tender obtained, together with all information relative thereto, at the office of the Street Cleaning Department, City Hall, Toronto.

**Toronto, Ont.**—Tenders will be received by the chairman of the Board of Control, up to Tuesday, February 16,

# Trade Gossip

**The Frick Co., Inc.**, Waynesboro, Pa., are distributing among their friends a month-by-month calendar printed in bold type and two colors.

**Alexander Elder**, the founder of the Elder-Dempster Steamship Line, died at Southport, England, on January 25.

**The Polson Ironworks, Ltd.**, Toronto, have received an order for shrapnel shells from the Government.

**Vancouver, B.C.**—The Vancouver and Victoria Boards of Trade have sent a petition to the Provincial Government asking for the appointment of a British Columbia trade commissioner for the West Indies.

**Berlin, Ont.**—At a representative and largely-attended meeting of manufacturers of Waterloo County here on Jan. 21, it was decided to energetically get after export trade, particularly in lines which were formerly supplied by Germany and Austria.

**Winnipeg, Man.**—The executive of the International Association of Machinists decided on January 21 to approach the Dominion Government with the suggestion that Canada send some of her surplus mechanics to the Old Country, there to be engaged in the production of munitions of war.

**The Turbine Equipment Co**, Toronto, has been awarded a contract by the Ver Mehr Engineering Co., Toronto, for three De Laval 36 in. double suction centrifugal pumps, each direct connected to a 300 h.p. motor. The capacity of each unit will be 36 million Imperial gallons per day and they will be used in connection with the Toronto Island filtration extension.

**Ottawa, Ont.**—The Toronto Terminal Railway Co. is applying to Parliament for legislation increasing the present limit of the company's bonding powers and also empowering it to acquire lands for and to construct, maintain and operate in Toronto freight and other facilities "in such manner and to such extent as the business of the company renders expedient."

**War Orders.**—An order from the Imperial Government for the partial manufacture of military uniforms, valued at $4,000,000, has been let to Canadian firms. The order calls for the production of 500,000 coats and trousers. Frederick Stobart, purchasing agent for the Imperial Government, also announces the ordering of one million canvas mess tin covers from Montreal, Ottawa and Winnipeg firms.

**Lake Superior Corporation.** — A change has taken place in connection with the Lake Superior Corporation administration, by which J. Frater Taylor resigns, and Thomas Gibson, of Toronto, takes the office. This was effected at a meeting of the Board held recently in Montreal. Mr. Taylor continues on the Board of the Corporation, but his reason for resigning was explained in that he has undertaken the management, as well as the presidency of the Algoma Steel Corporation and subsidiary companies.

**Lumber Cut Decreased.**—Reviewing the lumber trade of the Ottawa Valley, John Aird, assistant general manager of the Canadian Bank of Commerce, says the cut is estimated at 375,000,000 feet, or 100,000,000 feet less than for 1913, owing principally to low water conditions. In other sections of the province the decrease is proportionately greater. Dealing with market conditions, he predicts a revival of trade in the spring in the cheaper grades, but foresees even lower prices than in 1914 for higher grade lumber.

**Australia Raises Duty.**—The new Australian tariff increases the duty on Canadian farm implements in various degrees; some from free to 5 or 10 per cent.; some from 15 to 25 per cent., and some from 25 to 30 per cent., together with an increase in the specific duties. On pianos and organs the fixed duties are raised one pound sterling and the ad valorem from 35 to 40 per cent. The duty on the chassis of motor cars from Canada is increased from 5 to 10 per cent. There is also a 5 per cent. increase on many vehicle parts.

# Personal

**H. T. Glaubitz**, manager of the waterworks department at London, Ont., has resigned.

**George Sleeman** has been appointed chairman of the Guelph Light and Heat Commission.

**C. R. Hosmer** has been elected president of Canadian Cottons, Montreal, succeeding the late David Morrice.

**B. J. McCormick**, Industrial Commissioner for eight years at Welland, Ont., has resigned to accept a captaincy in the 44th Regiment.

**George H. Mullen** has been made president of the E. B. Eddy Co., Hull, Que., in succession to the late W. H. Rowley.

**Senator Nathaniel Curry**, president of the Canadian Car & Foundry Co., Montreal, has returned home after a business trip to the Old Country.

**Alexander Currie**, engineer at the Dominion Government fish hatchery on waterworks point, died suddenly on Jan. 20 at Collingwood, Ont., aged 76.

**A. W. Wheatley**, general manager of the Canadian Locomotive Co., Kingston, has gone to Russia to obtain orders for war material from the Government.

**J. M Jenckes**, manager of the Jenckes Machine Co., Sherbrooke, P.Q., was re-elected by acclamation as an alderman of the Sherbrooke City Council, at the municipal election, January 11, 1915.

**London, Ont.**—It is understood that Engineer Somerset, who is in charge of the Hydro-Radial Department of the Provincial Hydro-Electric Commission, is to be appointed manager of the London and Port Stanley Railroad.

**Hon. George A. Clare, M.P.**, president of Clare Bros. & Co., stove manufacturers, died at Preston, Ont., on January 9. Mr. Clare was born at Preston in 1854, and had been a member of the Dominion Parliament for South Waterloo since 1900.

**R. Schofield**, of the Schofield-Holden Machine Co., has disposed of his interest in the latter concern and has gone south for the winter to recuperate. Wallace C. Brown, who has been associated with Mr. Schofield for the past 14 years, is now general manager of the company.

**Horatio F. Forrest**, aged 76, a native of Montreal, and prominent civil engineer, died in Winnipeg on January 19. He was one of the engineers who located the C. P. R. track between Winnipeg and Kenora, and was afterwards Government inspector of railways and district engineer for the C. N. R.

**Vincent S. Jones**, for the past five years vice-president of the Harmsworth Company and general manager of the pulp and paper mills at Grand Falls, Nfld., has volunteered for service in Kitchener's army and is now with his old regiment, the "Borderers," as captain. William Scott, C.E., a director in the company, succeeds Mr. Jones as manager at Grand Falls Mills.

**William H. Rowley, J.P.**, president of the E. B. Eddy Co., Ottawa, Ont., and a familiar figure in the business world of Canada, died very suddenly at Toronto on January 12. Mr. Rowley was born at Yarmouth, N.S., on March 21, 1851, and

# Asbestolene

A lubricant that is manufactured specially to meet the growing demand for a high-grade friction-eliminating substance, one that prevents heat due to friction, and reduces that friction itself to the minimum.

## Axolene

It is the most economical grease. Where there is a demand for a heavier-bodied lubricant, this meets the requirements perfectly. It does not become hardened with age, it is not affected by atmospheric changes. It meets with general favor as a lubricant where slower speeds are to be encountered.

## *These Asbestos Lubricants*

**WILL SAVE YOU MUCH MONEY**

**by killing heat and friction, and eliminating to the greatest possible extent all ball-bearing troubles.**

**A TRIAL WILL CONVINCE YOU.**

**Ottawa, J. W. Anderson, 7 Bank Street Chambers**

from 1867 to 1886 was employed in banks in various capacities. In 1886 he organized the E. B. Eddy Co., becoming secretary-treasurer until 1906, when he was elected president.

**Col. Davenant Roger,** a prominent Canadian civil engineer, died on January 20, at Brooklyn, N.Y., in his 63rd year. He had been sent there by the Canadian Government to observe the construction of the Croton Aqueduct and the syphon under the Hudson River. Colonel Roger was at one time chief engineer for the Chilean Government. He also played a prominent part in the building of the C. P. R. and the Cape Cod Canal, and was about to start for Arizona to plan the construction of a large engineering undertaking.

**J. F. Armstrong, C.E.**, of St. John, N.B., will be recommended by Commissioner Wigmore for the position of engineer of the water and sewerage department of St. John. Mr. Armstrong completed his course in civil engineering at the University of New Brunswick in 1910, and later followed a post-graduate course in hydraulics at McGill University, Montreal. He was engaged for several years in laying out and installing water and sewerage systems in towns in Northern Alberta. He also practised general engineering with the C. P. R. Mr. Armstrong is a son of R. E. Armstrong, secretary of the board of trade.

## Refrigeration

**Edmonton, Alta.**—The United Farmers of Alberta at a convention just closed, prepared a resolution requesting the Provincial Government to co-operate in establishing a pork-packing plant.

**Calgary, Alta.**—J. C. Boyle, who has been prominent in packing circles in Alberta for the past twelve years, is negotiating with prominent financial interests for the bringing to this city of $1,000,000 for the construction and operation of a modern packing plant, capable of handling the surplus live-stock production of the district. Negotiations have been completed with Col. James Walker for a site for the plant.

## Wood-Working

**Stratford, Ont.**—The McLagan Furniture Co.'s latest order from the Dominion Government includes packing cases for the shells to be manufactured elsewhere in the city.

**Harriston, Ont.**—The shareholders of the Harriston Furniture Co. held a meeting on January 9, when it was decided to resume operations at the factory after a close down of about ten days. The appointment is announced of a new manager to fill the vacancy caused by the death of Mr. Leighton.

**Stratford, Int.**—R. D. Kilgour, vice-president of the Imperial Rattan Co., has purchased what hitherto has been a part of the output of that concern, the "Simplicitus" davenport. He is moving the concern to Toronto. The Imperial Rattan Co. is enlarging its own chair plant. Mr. Kilgour's connection with that company continues.

## Railways-Bridges

**Port Dover, Ont.**—The Lake Erie and Northern Railway Co. will proceed with the construction of the road from here to Brantford. The work involves the construction of two bridges at Brantford and Simcoe respectively.

**Quebec, Que.**—Incorporators of the town of Mount Royal, known as "Model City," at entrance to Canadian Northern tunnel, are asking for an extension of three years before members of the town council will have to qualify as residents.

**St. Thomas, Ont.**—A meeting was held in the city last Friday between representatives of Malahide, Aylmer, Yarmouth and St. Thomas, and George B. Woods and General Manager Warburton, of the London and Lake Erie Railway and Transportation Co., regarding the extension of the company's line from St. Thomas to Aylmer and from Union to Sparta.

**Hudson Bay Railway.**—Good progress on the Hudson Bay Railway has been reported to the Minister of Railways, by J. D. McArthur, of Winnipeg, contractor for the line. He stated that three hundred miles have been graded, while rails are down for two hundred miles. The grading to Port Nelson will be finished next summer, but the road will not be completed for a year and a half yet.

**Vancouver, B.C.**—An official announcement of the C. N. R. states that the tracks between the Yellow-head and coast sections would be connected up Saturday of last week, and the line will then be complete from Edmonton to Port Mann, fifteen miles from Vancouver. The next two months will be spent ballasting the line and making it ready for traffic. The ceremony of driving the final spike will probably not occur until April or May.

**Perth, Ont.**—Work on the Perth to Smith's Falls section of the Ottawa & St. Lawrence Electric Railway will begin in the spring, according to the promoters. The road will be 300 miles in length through Eastern Ontario, starting from Ottawa to Morrisburg, along the St. Lawrence through Brockville to Rockport, across by Charleston Lake to Athens, Frankville, Toledo, Smith's Falls, Perth, Lanark and back to Ottawa. Thirty miles in the eastern section is already constructed.

**St. Mary's, Ont.**—At the regular meetings of the new Water, Light and Heat Boards, steps were taken to arrange for a meeting at Kirkton to discuss power and radial railway projects. Delegates from Exeter and intervening points will be invited to be present. The board hopes to get something definite under way before long towards the building of a new line, which will go through St. Mary's, and open up to the Stone Town a new and important trade district.

**Kincardine, Ont**—The West Shore Railway, the ill-fated enterprise promoted by J. W. Moyes, may become a hydro-electric radial. In response to resolutions of some of the municipalities interested in the line, the Ontario Hydro-Electric Commission has prepared a report showing what can be done with the road. This document gives estimates of the cost of completing the line ready for operation, the annual revenue that may be expected and the annual operating expenses.

**Hamilton, Ont.**—While the engineers who met in Ottawa last week to go over the figures in connection with the separation of grades on Hunter Street did not come to any agreement as to figures, they discussed some important matters, and it was practically decided by them that to give the railway companies who use the Hunter Street line enough room, a large station would have to be built over the tracks similar to the new depot in New York City. This will cost more than the station between the proposed depression and Hunter Street that was first planned, but the saving in land damages will be great.

## Contracts Awarded

**Calgary, Alta.**—The Calgary Saddlery Co. and Riley & McCormick Co. have been awarded part of the large contract let in Canada by the agents of the Russian Government for saddles.

**Fort William, Ont.**—A contract for a 750,000-bushel addition to the Ogilvie Milling Co. elevator has been given to the Barnett-McQueen Co. The figure for the work is about $200,000.

**Kenora, Ont.**—A contract for digging the channel from Indian Bay to Snow-

shoe Bay, on Shoal Lake, has been awarded by the Administration Board of the Greater Winnipeg water district to C. J. Anderson of Kenora, he being the lowest tenderer. Mr. Anderson's tender for the work was $12,765.

# Building Notes

**Toronto, Ont.**—A building permit has been issued to S. Yolles for the erection of a four-storey brick warehouse and factory, costing $25,000, at 579-85 Richmond Street West.

**Toronto, Ont.**—The Ontario Hydro's new office building, in course of erection on University avenue, may be occupied in August. Excavation for the foundation goes down sixty feet to reach bedrock.

**Vancouver, B.C.**—Sir Richard McBride has announced that the erection of permanent buildings of British Columbia's new university will have to be postponed until a more favorable time comes for raising money. The staff has been engaged and plans are all ready.

**St. John, N.B.**—The University of New Brunswick, is raising funds for the purpose of erecting a new Science Building. About $17,000 has been contributed to date. J. T. Jennings is president.

# Marine

**New Liskeard, Ont.**—The work of extending the present breakwater has been commenced. Fifty feet will be added to the structure.

**New Westminster, B.C.**—The steel tug "Queen," built by the Westminster Marine Railway for Greer & Coyle, of Vancouver, B.C., was launched from the builders' shipyard on Lulu Island on Jan. 19, and towed to the wharf of the Vulcan Ironworks for the installation of oil tanks. The Queen is an oil burner, and will be used by the owners in the log-towing business mainly. She is 87 feet long, 20 feet beam and has a maximum draught of ten feet. A big party, including many visitors from Vancouver, witnessed the launching of the vessel, which was the occasion of considerable enthusiasm among those concerned. It is about six months since the new vessel was laid down.

## COMMERCIAL MUSEUM.

THE Hon. Robert Rogers, Dominion Minister of Public Works, has outlined a plan by which it is hoped to further the desire of Canadian manufacturers to put themselves in a position to replace goods of German and Austrian manufacture with those made in Canadian factories.

"There is now under consideration," says Mr. Rogers, "the establishing of a commercial museum for the purpose of displaying processes and products characterizing the great import trade from Europe to Canada. Object lessons should be given and practical teachers engaged to give details regarding materials and methods. Manufacturers and consumers will then be able to find out, before patronizing foreign countries, whether they can get in Canada what they require."

## DOMINION TRADE WITH BRITAIN.

THE following are the official figures of trade between Canada and Great Britain in the undermentioned articles during December, 1914:—

| Imports from Canada— | Dec. 1914. | Dec. 1913. |
|---|---|---|
| Wheat | £1,440,358 | £911,469 |
| Wheat meal & flour | 155,516 | 196,171 |
| Oats | 13,235 | 34,525 |
| Barley | 16,296 | 27,790 |
| Bacon | 162,698 | 52,031 |
| Hams | 21,464 | 23,083 |
| Cheese | 372,236 | 236,875 |
| Canned salmon | 91,393 | 149,731 |
| Canned lobsters | 7,294 | 5,635 |
| Exports to Canada— | | |
| Spirits | 24,091 | 52,970 |
| Wool | 10,939 | 14,348 |
| Pig iron | 520 | 2,085 |
| Wrought rails | .... | 1,403 |
| Galvanized sheets | 8,137 | 8,564 |
| Tinned plates | 5,468 | 6,244 |
| Steel bars | 4,638 | 11,698 |
| Pig lead | 1,145 | 4,580 |
| Cutlery | 4,490 | 5,247 |
| Hardware | 2,966 | 6,039 |

## ST. JOHN, N.B.

IT is extremely doubtful whether any other city in Canada has stood up so well under the disturbing conditions of commerce during the past two years as has the city of St. John, the commercial capital of New Brunswick, and the premier winter port of Canada.

The fact that St. John is the nearest Atlantic port to Montreal and the great Canadian West, gives it a very decided advantage in the commercial race. It cost the people of St. John about a million and a quarter dollars to demonstrate to the transportation companies and the Government of Canada than in St. John they have a national port that was worth developing. Since that demonstration was successfully made, providing the necessary harbor facilities has furnished employment summer and winter for a large number of people. This development work has been going on uninterruptedly for several years, and, with the demands that ocean commerce are making, must go one for many years to come.

### Recent Opening of New Dock.

A few weeks ago, another milestone on the commercial career of St. John was reached, when the big dock for the C.P.R., which a small army of laborers have been working on night and day for over eight months, was completed and formally handed over to the Federal Government. In the construction of this dock, between 500 and 700 men were employed; fifteen million feet of lumber went into crib work; 150,000 cubic yards of mined rock were utilized for ballast; 200 carloads of cement were consumed in concrete work. The Federal Government built a temporary shed, 800 feet long by 50 feet wide, on the pier, and the C. P. R. have laid down two lines of track alongside it.

### Harbor Development

The harbor development at East St. John, which is under contract to the Norton, Griffiths Co., is going steadily forward. Several hundred men are employed in this undertaking, and the Hon. Robert Rogers, Minister of Public Works, stated at a public meeting during the month that the dry dock, which forms part of this East St. John scheme, will be enlarged to 1150 feet in length, making it the same size as the docks at Esquimalt and Halifax. A large business has been done in St. John during the closing months of the year in the shipping of remounts for the British army.

The construction of a new post office, the building of a large brick immigration building on Partridge Island, the erection of a tuberculosis hospital, besides a number of private erections, have kept carpenters and other builders fairly busy, so that there has been little complaint so far from unemployed.

The new steel bridge, which spans the reversing falls at St. John, is well advanced. The main bridge has been thrown across the river, and workmen are now employed in filling in the details. It will be completed next spring, and will be used by the Street Railway Company, as well as for general traffic. The completion of this bridge will open up some splendid residential and industrial possibilities in Fairville and West St. John.

The Street Railway Company has this year extended its lines towards the new dry dock site at East St. John, and also in the direction of Coldbrook, near which point the Glen Falls Development Co. are pushing a residential and industrial scheme. A. H. Likely has asked the city council to guarantee the bonds of a building company which proposes to erect several hundred workmen's houses at East St. John, near the harbor works.

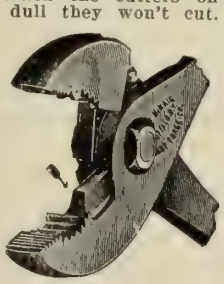
Large yard next to building if desired. Apply Jos. Bonhomme, 200 Guy Street, Montreal. (4)

**McKaig's Combination Pliers**

**A new invention, an improvement over the old style.** When the cutters on other pliers get dull they won't cut. **"SURE CUTTERS" will cut perfectly, no matter how dull the edges get.**



When the hold gets loose on other pliers, they won't cut — but "SURE CUTTERS" do the work just the same.

**Try them**—order now, before you forget it.

**McKaig Drop Forge Company**
**Buffalo, N.Y.**

Armstrong & Bruce, representing another building syndicate, are also arranging for residential development at a point near the street railway line at the Douglas Road junction. The Fenton Land and Building Company have constructed a number of handsome residences at West St. John and in the city proper. Other building companies have also been active. Real estate has been very quiet the past year, but values have not depreciated. The winter port business is now well opened up, and the outlook for a profitable season's work is excellent, considering war conditions.

### Value as a Distributing Centre.

The fact that St. John is the gateway for the St. John river gives it a great advantage and adds greatly to its value as a distributing point. This summer a large traffic was carried over the St. John river to St. John, principally of lumber. Much of this came from Maine points. The first quarter of 1913 showed the value of lumber exports through the port of St. John to the United States to be $297,539.34; second quarter, $451,942.-61; third quarter, $407,647.40; fourth quarter, $370,140.24. Shipments of lumber from St. John to the United Kingdom, the European Continent, Australia and South Africa, during 1913, were as follows: Spruce deals, 80,714,861 sup. feet; hardwood plank, 5,823,761 sup. feet; birch timber, 2,307 tons.

Bank clearings at St. John in 1913 amounted to $82,447,747. This year the figures make a particularly favorable showing so far, the totals up to December 10 being $78,836,709. The clearing house figures for the week ended December 3, 1914, show that St. John and Ottawa were the only two cities in Canada in which there had been increases over the previous year. St. John's increase for the week amounted to $321,715, while that of Ottawa was $263,276. Building permits at St. John in 1913 amounted to $2,380,660; in 1912 they were $561,700. Figures are incomplete for 1914, but the showing, considering everything, is a good one. The value by months in 1914 is as follows: January, $10,000; February, $3,700; March, $78,500; April, $72,-300; May, $79,700; June, $50,050; July, $110,400; August, $29,800; September, $10,450; October, $32,550; November, $20,950.

Cleveland, Ohio.

The exports during 1913 were valued at $25,594,721, as against $21.895.963 in 1912; imports 1913, $9,873,026; 1912, $8,-590.197. During 1913, 2,269 vessels entered the port. Grain exports during the winter season of 1913-14 amounted to 7,619,346 bushels, representing a value of $7,119,300. This was a slight falling-off over the two previous years. The customs receipts in 1913-14 amounted to $1,678,235.39, as against $1,760,639.45 in 1912-13.

A very interesting record of the city's progress is shown by its post office transactions during the past nine years. In 1904, the postal revenue at St. John amounted to $80,941.87, while in 1913 it had swollen to $141,068.11, the growth being steady during all that period with the exception of 1907, when there was a falling-off of about $8,000. The growth of population, while not rapid, has been of a healthy character. At the present time it is between 55,000 and 60,000 people.

### War Effects.

It would be useless to deny that St. John has not suffered by the war. It has caused dislocation in many lines, but on the whole business is in a fairly healthy state, and the people are feeling optimistic. The shipping industry has received a great stimulus from the war, and freights have advanced to a point unheard of for many years. The lumber mills have been kept quite busy but some of them are slackening up a little now.

St. John has a very active Board of Trade, and one of its chief endeavors since the war started has been to stimulate business confidence. In this it has been wonderfully successful. Quite recently, it sent out circular enquiries to all the Maritime Boards of Trade, and the returns showed that throughout the whole territory, with only an occasional exception, business was being well sustained.

The farm crops this year in New Brunswick have been particularly good. Potatoes have been a large crop, there being a surplus of about 8,000,000 bushels for export. Hay showed a surplus of about 25,000 tons; cheese, 800,000 pounds. There were small surpluses for export in mutton, swine, poultry, oats and apples. In wheat, the province raised this year 25 p.c. of the amount needed for home consumption. The indications are that during the coming saeson a very much larger acreage will be planted. On the whole, both city and province have made fairly good progress during the first year.

## Catalogues

**McLain's System.**—A bulletin, containing a synopsis of twelve lessons, giving particulars covering grey iron mixtures, cupola practice and the making of semi-steel, has been recently issued by McLain's System, Milwaukee, Wis. Each lesson deals with a different phase of foundry practice.

**Friction Hoist.**—The Herbert Morris Crane and Hoist Co., Toronto, are distributing bulletin B-11, dealing with the Morris belt-driven friction hoist. General particulars and prices are given of hoists with working loads up to one ton. Two illustrations of hoists in operation are given, while diagrams are included of suspended and floor type hoists, showing principal dimensions for each size.

**Lighting Systems.**—A comprehensive general catalogue, No. 71, has been issued by the National Stamping and Electric Works, Chicago, Ill. The principal systems described are the "Acme" air light gas system and the "Nulite" hollow wire lighting system. A full description is given of each, with instructions for installing and operating, accompanied by diagrams. Particulars are given of the various fittings and also of the gasoline portable and stationary lamps. The catalogue is fully illustrated and shows many different styles of lamps and chandeliers.

**Pelton Wheels.**—Bulletin No. 8, issued by the Pelton Water Wheel Co., New York and San Francisco, Cal., describes Pelton wheels particularly adapted to driving mining, saw mill and industrial machinery generally. The catalogue has been published with a view of acquainting the prospective purchaser with a few types of standard designs. For fuller particulars of the subject the reader is referred to other publications to be had from the company. This bulletin, however, contains much useful information both as regards the construction of the Pelton wheel and other hydraulics. Pipe friction and weir measurement tables are included, also tables giving the size of wheel and horse-power for various heads. The bulletin is fully illustrated and shows several views of installations, pipe lines and pipe details, etc.

**$CO_2$ Recorder.**—Those interested in boiler room efficiency will find in bulletin No. 100, entitled "Combustion and Cost of Power," issued by the Uehling Instrument Co., Passaic, N.J., much valuable information regarding the measurement of waste heat in flue gases. The bulletin describes how waste heat may be measured and how a considerable saving in coal may be effected by a proper understanding of the subject. The Uehling $CO_2$ Recorder is described, and method of measuring dealt with

METAL STAMPINGS

We are manufacturers of stamped parts for other manufacturers.

We do any kind of sheet metal stamping that you require. Our improved presses and plating plant enable us to produce the finest quality of work in a surprisingly short time.

We can finish steel stampings in Nickel, Brass or Copper.

Send us a sample order.

YOU CAN FEEL
the Superiority
of "DELTA" FILES

when they first go on the job—they cut so easily and smoothly.

AND YOU CAN SEE IT

in its quality of work and length of service.

Half a century's experience in hardening, tempering, and cutting, combined with the use of CRUCIBLE STEEL THROUGHOUT in files from 3 to 24 inches, is what makes the distinctiveness in "Delta" service.

There's a style for every service. **Why not get one from your dealer, and put it to a test in competition with the kind you now use?** Every "Delta" Dealer is authorized by us to refund the purchase price if a customer is not satisfied.

TRADE MARK
DELTA

This trade-mark is your guarantee—it's on the tang of all Delta Files. Be sure to look for it.

# SAVE TIME!

## USE KEYLESS DRILL CHUCKS

The "KUPKE"

KEYLESS drill chucks are as much a part of the modern shop's equipment as are high-speed tools. Fundamentally, for the same reason, THEY SAVE TIME.

Our "Gronkvist" Automatic High-Speed Drill Chuck and our "Kupke" Keyless Drill Chuck have a great many time and money-saving features in their favor. They are simple, durable and guaranteed to give satisfaction. The guarantee covers not only that our claims are facts, but also that our tools FOR YOUR REQUIREMENTS are superior to the chucks you now are using.

HUNTER SAW & MACHINE CO., Pittsburgh, Pa., U.S.A.

fully. The Uehling waste meter is also illustrated and described. The bulletin contains 36 pages of interesting matter, and also a number of illustrations and diagrams.

**Centrifugal Pumps.**—What is probably the most complete commercial publication devoted solely to centrifugal pumps is being distributed by the De Laval Steam Turbine Co., of Trenton, N.J. This book of 298 pages contains over 300 illustrations, including centrifugal pumps for all capacities and heads, and for motor and steam turbine drives. Diagrams show the characteristics of such pumps and explain the relations between impeller blade angles and characteristics. There are also numerous illustrations of the DeLaval reducing gear employed to allow electric motors, water turbines, steam engines and steam turbines to operate at the most economical speed when driving a centrifugal pump. The text matter is divided into chapters under such headings as "The Introduction of the Centrifugal Pump and the Work for Which It Is Adapted"; "Features to be Considered in Selecting Centrifugal Pumping Equipment"; "The Use of the Characteristic Curve"; "Methods of Testing Centrifugal Pumps"; "System of Manufacture for the Production of Interchangeable Parts"; "Details of Design and Construction of Single-stage and Multi-stage Pumps"; "The Speed Question, Particularly Relating to Steam Turbine-Driven Centrifugal Pumps"; "Helical Speed-reducing Gears"; "Motor and Belt Drives"; "High Duty Steam Turbine-Driven Pumps as Compared with Reciprocating Pumping Engines for Water-works Service"; "The Adaptation of Pumps for Circulating Condenser Water, Feeding Boilers and Other Steam Power Plant Service"; "Drainage and Irrigating Pumps"; "Hydraulic Pressure and Elevator Pumps"; "Pumps for Marine Uses, Mining Service, Fire Service and Hot Water and Brine Circulation," etc. Tables and charts are given for determining the resistance of pipes and the relation between heads and spouting velocities. The investigation of the pumping problem, together with drawing up of specifications for centrifugal pumps, are also treated at some length. The chapters on "Pump Characteristics" will prove valuable to the pump user, while that on "Water-works Pumps" will be a revelation to many who have not recently given this matter consideration.

# "CANSTEEL"

FIREPROOF INTERIOR EQUIPMENT FOR FACTORY & OFFICE

STEEL LOCKERS in your office and factory mean that you will save that time that your employees now waste in storing away their wearing apparel twice every day.

Let us show you how they will prove an investment. An inquiry does not mean any obligation on your part.

**Write now** before you forget.

# The Measure of a Drill

Pick out a drill—its looks, its price, count for little. The measure of a drill is—How many holes will it make?

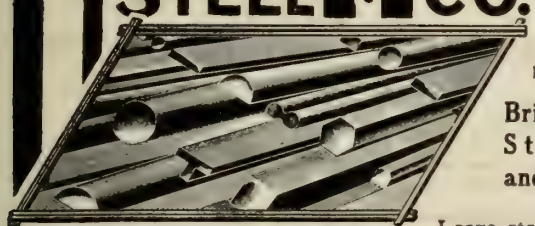
## Cleveland Twist Drills

measure up because of their well known hole-producing qualities.

*Are you getting "Drill Chips" each Month? If not, ask for it.*

**The Cleveland Twist Drill Co.**
**New York Cleveland Chicago**

# UNION DRAWN STEEL CO. LTD.



**HAMILTON, ONTARIO**

Manufacturers of **Bright Finished Steel Shafting and Shapes.**

Large stock of all sizes.

***Send for Price List***

# BIG

**RESULTS**

from small investments. This little advertisement will give you an idea of the use you can make of smal space.

## *"Bemis & Call"* Combination Wrench

DOES THE WORK OF A NUT WRENCH AND PIPE WRENCH. IS EQUALLY HANDY AND EFFICIENT IN EITHER CAPACITY, AND COSTS BUT LITTLE MORE THAN AN ORDINARY WRENCH.

Head, Bar and Shank one-piece steel forging. Made from the best of materials. Thoroughly case - hardened. All parts interchangeable.

Write for complete catalog on wrenches.

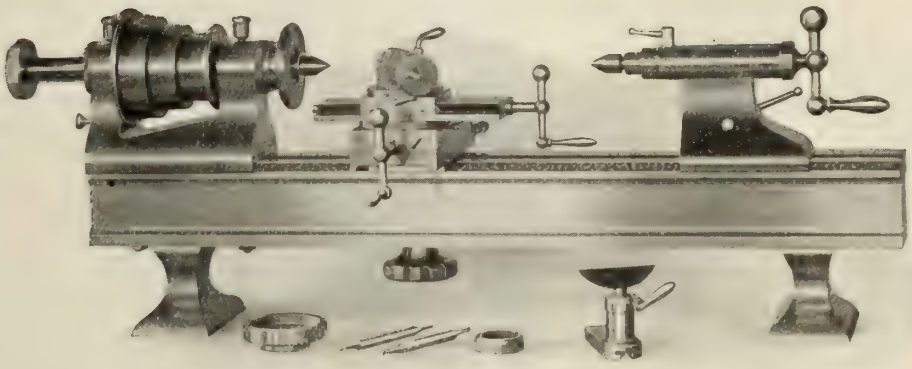
# A Lathe Designed and Built for Accurate Work



**Rivett No. 4 Lathe and Slide Rest**

In the selection of a Bench Lathe the fact should be borne in mind that one of the essential features of such a machine is Accuracy.

Work done on a Bench Lathe does not, as a rule, allow of liberal limits of error and therefore the Lathe must be one to be depended upon.

Rivett Lathes are well known for their rigidity, refinement in design and lasting accuracy.

## Are You Interested?

Is there not a number of jobs that could be done on a small Lathe and which are now tying up the Engine Lathes in your shops, usually when you need them most?

*We gladly send catalogue and other descriptions.*

## Giving a Brown & Sharpe Automatic Gear Cutting Machine the Final Exacting Test.

A Gear Cutting Machine is only as accurate as its indexing mechanism. B. & S. Index Wheels are cut with Master Wheels as exact as they can be made. After they are carefully mounted they receive this sensitive test, which shows the slightest error in the teeth. Then there is another test to detect errors in the rotating mechanism. You need have no doubt of the accuracy of the gears cut on machines passing these tests.

In addition, B. & S. Automatic Gear Cutting Machines are planned throughout for rapid operation. Quick setting up of the job due to convenience, withdrawing cutter and indexing always at a fast rate, sturdy construction allowing fast feeds,—these are a few of the efficiency points.

REMEMBER—BROWN & SHARPE AUTOMATIC GEAR CUTTING MACHINES PRODUCE GOOD GEARS RAPIDLY.

A THOUSAND wishes alone would not bring you success in 1915. Although we do sincerely wish you all prosperity in the New Year we are prepared and waiting to back up our wishes with a real and tangible service.

If you are a subscriber, let CANADIAN MACHINERY help you in 1915.

If you are a buyer of Machine Tools, consult this directory and the advertising pages.

If you are a manufacturer of Machinery or a Dealer, we can help you to bigger business and a more lasting connection.

Is your name in this directory? If so, there is reasonable expectation that our wishes for your enjoying a prosperous year shall be fulfilled.

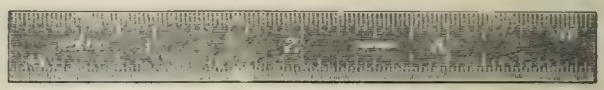
## TAPES AND RULES

## NOTED FOR ACCURACY

We make a complete line of

MACHINISTS' SCALES — MEASURING TAPES
FOLDING STEEL RULES — WOOD RULES
FOLDING BOXWOOD RULES
SPRING JOINT RULES



Our goods are stocked by prominent hardware and supply houses throughout the Dominion. They are fully guaranteed.

**Catalogue on request.**

THE LUFKIN RULE CO. OF CANADA, LTD.
WINDSOR, ONT.

# No, Stevens' Stopper won't stop a train, but it will stop the blow hole in a defective casting so that you cannot find it.

In this way, it helps your bank account. The casting that otherwise would have to go to the scrap heap can be converted into good coin of the realm.
Same color as the rest of the casting. Doesn't look like a blue patch on Casey's faded overalls.
*How to use Stevens' Stopper, or Circle Cement:*
Stevens' Stopper is a fine powder, used with a little water and made into a paste—the hole is easily filled with a putty knife or trowel. It takes anywhere from two to twenty-four hours, depending upon the size of the patch, for the filler to become as hard as the casting itself. When rubbed with a file it shows the color of the casting, hence it is the best filler and the one thing that saves your castings, and that means the saving of your dollars.
Another thing—I do not ask a fancy price for it.
A pound will save many dollars' worth of castings. Put up in 5-lb., 10-lb., and 25-lb. cans.

## FREDERIC B. STEVENS

The "HENDEY" Lathe

# The Service

## Capacity and Convenience

of a Hendey Lathe will prove of vital importance to your tool room.

The **"Hendey"** is accurate in the highest degree and **suited for the efficient use of watch tool chucks, stop chucks, relieving attachments, etc.**

It has the best spindle construction in its taper journals, with annular bearings and automatic oiling rings, which make for accuracy of alignment.

It has **automatic stop** for carriage working in either direction. Has reverse for carriage, controlled from apron.

Wide range of threads and feeds through mounted gearing, with ability to make gear changes for additional threads and feeds without limit.

**A card will get you full particulars. Why not mail it now?**

# Are You Satisfied That Your Polishing Methods Cannot Be Made Better?

Polishing is one of the operations that is making rapid strides toward greater efficiency through the use of

## NORTON ALUNDUM GRAIN

Possibly the test which is cited below may have some practical application to your own polishing problems.

A manufacturer of road machinery was polishing 90 point carbon steel mould boards—6 to 18 feet long and 6 to 18 inches wide—by first roughing out with a solid wheel and then finishing with a polishing wheel. The solid emery wheels were replaced by extra soft, compressed canvas polishing wheels, coated with No. 36 T. J. Alundum. For the finishing operation No. 80 T. J. Alundum was substituted for No. 46 emery. By these changes the time for the complete operation was reduced to the time originally required for the roughing out.

*If you are interested, we will gladly demonstrate.*

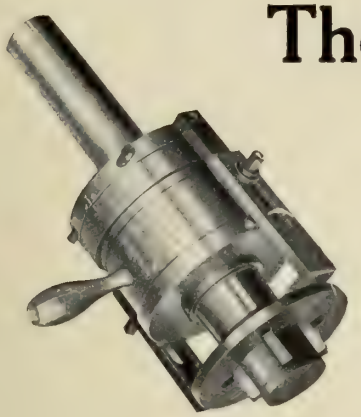
# CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields. Published by the MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg and London, Eng.

Vol. XIII | Publication Office: Toronto, February 4, 1915 | No. 5



## The Most Worn Path Shows the Shortest Cut

**Our Order Books Show that GEOMETRIC THREADING TOOLS Are the Shortest Cut to the Production of Correct Screw Threads.**

Manufacturers of Threaded Parts, whether an internal or external thread, want Geometric Screw-Cutting Tools—and they want them now. We have been hit by the wave of busy-ness that is spreading over this Hemisphere.

Turret Lathe Manufacturers are ordering Geometric Thread-Cutting Tools for their Machine Equipment.

Contractors for Government work are ordering Geometric Collapsing Taps and Self-Opening Die Heads for filling their contracts.

We are meeting these demands with the tools that have made Screw-Cutting easy.

GREATEST QUANTITY AND FINEST QUALITY AT LEAST OUTLAY.

Geometric Thread-Cutting Tools are furnished in many sizes and types to suit all classes of thread cutting. Each size tool covers a wide range of diameters.

**Send in your specifications and place your order now. The order for one tool receives the same attention as the order for fifty or more.**

# Are You Satisfied That Your Polishing Methods Cannot Be Made Better?

Polishing is one of the operations that is making rapid strides toward greater efficiency through the use of

## NORTON ALUNDUM GRAIN

Possibly the test which is cited below may have some practical application to your own polishing problems.

A manufacturer of road machinery was polishing 90 point carbon steel mould boards—6 to 18 feet long and 6 to 18 inches wide—by first roughing out with a solid wheel and then finishing with a polishing wheel. The solid emery wheels were replaced by extra soft, compressed canvas polishing wheels, coated with No. 36 T. J. Alundum. For the finishing operation No. 80 T. J. Alundum was substituted for No. 46 emery. By these changes the time for the complete operation was reduced to the time originally required for the roughing out.

*If you are interested, we will gladly demonstrate.*

# An Unusual Opportunity for Business

**Shell Manufacture.**—Representatives of various manufacturing companies are in Ottawa this week conferring with the Government in connection with the construction of shells. These companies, the demand for whose normal output has been seriously interfered with by the war, are anxious to take advantage of a demand which promises to be fairly brisk for some time to come and to manufacture a product which can be profitably disposed of. Already a large number of manufacturing firms have put in the plant necessary for such manufacture, and it is estimated that the total output of Canadian shells will soon approximate 100,000 per day. It is expected that this will shortly be increased until 200,000 per day are being turned out for the cannon of the allies.

The item, "Shell Manufacture," reproduced from the January 21st Canadian Machinery indicates increased and renewed activity in machine shops and metal-working plants in general.

Do you appreciate just what it will mean to turn out 200,000 shells per day? Do you realize how many shops, how many men, and how many machines it will require?

At first only seven or eight firms were given orders for shells. Soon scores will be busily engaged in this most unusual business. Even now shells are being turned out in shops as far west as Winnipeg and as far east as Nova Scotia.

Much new equipment will undoubtedly be required and the situation is one that suggests prompt action on the part of those having the necessary machines, tool steel, taps and dies, furnaces and other appliances, bringing their lines to the attention of probable buyers.

Now is the time to take advantage in a big way of the splendid circulation of Canadian Machinery, if you wish to secure your share of orders being placed for shell-making machinery.

# The Production of Iron and Steel in Canada During 1913

By John McLeish, B.A.*

*Iron and steel enter so largely into the industrial life of our country as constituents of manufacturing equipment and as the products of the latter that interest never flags in but rather looks forward with anticipation to statistics of every particular bearing thereon. This data from a recent Government report will therefore be found educative and valuable.*

STATISTICS of iron ore, pig-iron and steel production gathered from the Department of Mines (Ottawa) report just issued for 1913, show increased shipments of iron ore from Canadian mines, an increased production of pig-iron and steel in Canadian furnaces and steel plants, and an increase in the imports of most classes of iron and steel products; but the general relationship of domestic iron ore supplies to furnace requirements exhibits no important change from the conditions that have obtained for a number of years past. Canadian furnaces continue to be operated almost entirely on imported ores, and Canadian iron and steel plants supply probably less than 30 per cent. of the present consumption.

Comment has previously been made on the comparatively small proportion of Canada's consumption of iron and steel now supplied from the country's domestic resources, and this fact is again emphasized in the statistics of production, imports, and exports for 1913. It is somewhat difficult to arrive at a complete estimate of the total consumption of iron in Canada because of the large value of iron and steel goods imported for which the quantity cannot be stated, nevertheless the percentage of consumption available from Canadian mines can be closely gauged. The imports and exports of iron and steel goods (not including iron ore) may be sub-divided into two classes, comprising the materials of which the quantity is stated and materials or goods of which the value only is recorded.

### Value of Net Total Imports.

It is probably safe to estimate that the value of $72,181,060 of net imports represents not less than 100,000 tons of iron or steel and probably not more than 720,000 tons. Assuming these limits and assuming further that the iron or steel represents 50 per cent. of the original ore charged, we have net imports of iron and steel goods (exclusive of iron ore) equivalent to a tonnage of iron ore between the limits of 3,761,186 tons and 5,004,806 tons. Adding the consumption of iron ore in Canadian iron and steel furnaces, we have a total equivalent consumption of iron ore not less than 6,066,464 tons and probably not exceeding 7,310,088 tons. The production of iron ore in Canada in 1913, viz., 307,634 tons, was, therefore, sufficient to supply probably over 4.2 per cent., but not more than 5 per cent. of the country's requirement of iron.

*Chief of the Division of Mineral Resources and Statistics.

### Iron Ore.

The total shipments of iron ore from Canadian mines in 1913 were 307,634 tons, valued at $629,843 at the shipping point, as compared with shipments in 1912 of 215,883 tons, valued at $523,315. Of the total shipments in 1913, 91,020 tons were sent to blast furnaces in Canada 196,151 tons to the United States, 12,927 to Scotland, and 7,536 tons to Holland. The shipments comprised 92,386 tons of hematite and roasted siderite, 209,886 tons of magnetite (including some ores with an admixture of hematite), and 5,362 tons of titaniferous iron ore. Shipments in 1912 included 86,971 tons of hematite, 127,727 tons of magnetite, and 1,185 tons of titaniferous ore. Nova Scotia, New Brunswick, Quebec and Ontario were the shipping provinces. No production has been reported from British Columbia for the past seven years.

### Exports and Imports of Iron Ore.

According to returns received direct from mine operators, 196,151 tons were shipped to the United States, 12,927 tons to Scotland, and 7,536 tons to Holland, or a total of 216,614 tons shipped to destinations outside of Canada during 1913. The exports from Canada during this period, according to the records published by the Department of Customs, were 126,124 tons valued at $426,681, and included 107,624 tons valued at $355,641 to the United States, 11,800 tons valued at $45,312 to Great Britain, and 6,700 tons valued at $25,728 to other countries.

The exports in 1912 were 118,129 tons valued at $382,005, including 95,579 tons valued at $295,213 to the United States, 16,800 tons valued at $64,712 to Great Britain, and 5,750 tons valued at $22,080 to other countries. The exports in 1911 were 37,686 tons valued at $133,411, all to the United States. That the Customs Department record of exports to the United States would appear to be understated in 1913 is confirmed by the record of imports of iron ore into that country from Canada, as shown in the "Monthly Summary of Commerce and Finance of the United States." According to this authority the imports of iron ore into the United States from Canada during the calendar year 1913 were 201,489 short tons valued at $413,314, as compared with 119,476 tons valued at $201,882 in 1912, and 56,538 tons valued at $106,038 in 1911.

The imports of iron ore into Canada were not separately shown by the Customs Department until April, 1912. The imports during the twelve months ending December, 1913, were reported as 1,942,325 tons valued at $3,877,824, and during the nine months ending December, 1912, 2,047,509 tons valued at $3,932,074. The imports in 1913 included: 1,072,156 tons valued at $3,007,653 from the United States, 869,669 tons valued at $869,669 from Newfoundland, and 500 tons valued at $502 from other countries.

There were used in Canadian furnaces in 1913, 2,110,828 tons of imported iron ores, as compared with 2,019,165 tons in 1912, the imported ores being obtained chiefly from Newfoundland and the iron ranges on the south shore of Lake Superior. The Newfoundland deposits are operated by the two Canadian companies operating coal mines and steel plants at Sydney and Sydney Mines in Cape Breton, and the total quantity of Newfoundland ores shipped during 1913 from the Wabana mines was 1,605,920 short tons, of which 1,048,432 tons were shipped to Sydney and 557,488 tons to the United States and Europe. In 1912 the shipments from Wabana, Newfoundland, were 1,331,912 short tons, of which 956,459 tons were shipped to Sydney and 375,453 tons to the United States and Europe.

According to the "United States Report of Commerce and Navigation," there were exported to Canada during the twelve months ending June, 1913. 1,367,928 tons (2,000 pounds) of iron ore valued at $3,684,233, and during the previous year 931,647 tons (2,000 pounds) valued at $2,806,238.

### Pig-Iron and Steel.

The making of iron and steel in Canada is an industry which has been built up largely on the basis of imported ores, and the output continues to increase. The total production of pig-iron in 1913, not including the output of ferro products which is separately tabulated, was 1,128,967 short tons (1,008,006 long tons) valued at approximately $16,540,012, as compared with 1,014,587 short tons (905,881 long tons), valued at $14,-

550,999 in 1912, and 917,535 short tons (819,228 long tons), valued at $12,307,-125 in 1911. An increase of 11.3 per cent. is shown in the production of pig-iron in 1913 over the production of 1912, as compared with an increase of 10.5 per cent. in 1912 over that of 1911.

### Pig-Iron Furnaces.

At the close of the year Canada had twenty-two completed furnaces grouped in twelve separate completed plants owned by nine companies or corporations. Of the twenty-two completed furnaces, five have been idle throughout the past two years, namely, the furnace at Londonderry, N.S., and the three small furnaces in the Province of Quebec, owned or controlled by the Canada Iron Corporation, and the furnace of the Atikokan Iron Company at Port Arthur. The aggregate daily capacity of these five furnaces was approximately 235 tons. During 1913, however, three new furnaces were brought into operation, with a total daily capacity of about 665 tons.

Of the total output of pig-iron in 1913, 23,696 tons valued at $423,140, or $17.86 per short ton, were made with charcoal as fuel, and 1,105,271 tons, valued at $16,116,872, or $14.58 per ton, with coke. The amount of charcoal pig-iron made in 1912 was 21,701 tons, and in 1911, 20,759 tons, while the quantity made with coke in 1912 was 992,886 tons, and in 1911, 896,776 tons.

The classification of the coke iron production in 1913, according to the purpose for which it was intended, was as follows: Bessemer 265,685 tons; basic 614,845 tons; foundry, including miscellaneous, 224,741 tons. The classification of the production in 1912 was: Bessemer, 256,191 tons; basic, 544,534 tons; foundry, including miscellaneous, 192,161 tons.

### Provincial Pig-Iron Output.

The total production of pig-iron in 1912 and 1913 belongs to the Provinces of Nova Scotia and Ontario; the Province of Quebec have dropped out during these years, although formerly there had been a continuous though small output of charcoal iron which commanded a high price.

During 1912, Nova Scotia produced 424,994 tons of a value of $6,374,910, and in 1913 its output was 480,068 tons of a value of $7,201,020. During 1912, Ontario produced 585,593 tons of a value of $8,176,089, and in 1913 its output was 648,899 tons of a value of $9,338,992.

It should be explained that the value placed upon the pig-iron production of Nova Scotia is assumed or estimated, a large proportion of it being directly converted into steel, and the remainder only being sold as pig-iron.

### Exports and Imports of Pig-Iron.

The total exports of pig-iron, including ferro-alloys, during 1913 were 6,326 tons valued at $351,646, or an average value per ton of $55.59, as compared with exports of 6,976 tons valued at $310,702, or an average of $44.54 in 1912. The exports during the past five years have not exceeded 10,000 tons in any one year, and have consisted largely, if not entirely, of ferro-alloys.

Considerable quantities of pig-iron are annually imported into Canada. During the calendar year 1913, the total imports of pig-iron, excluding ferro products which are separately stated, were 236,769 tons valued at $3,247,405, and included 213,969 tons valued at $2,888,-974, or an average of $13.50 per ton, from the United States, and 22,800 tons valued at $358,431, or an average of $15.72 per ton, from Great Britain. The total imports in 1912 were 272,565 tons valued at $3,511,599, or an average of $12.88 per ton; and in 1911, 208,487 tons valued at $2,610,989, or an average of $12.52 per ton. The 1913 imports included 926 tons of charcoal pig-iron valued at $12,528, or $13.52 per ton, as compared with imports of 115 tons of charcoal pig-iron in 1912 valued at $1,-370, or an average of $11.91 per ton.

### Ferro-Products.

Ferro-silicon, ferro-phosphorus, and ferro-manganese were produced in Canada in electric smelting plants in 1913, the latter two products in small quantities only. Ferro-silicon and ferro-manganese were made at Welland, Ont., by the Electro Metals, Ltd., and ferro-phosphorus was made at Buckingham, Que., by the Electric Reduction Co. The Algoma Steel Corporation did not operate their electric furnace at Sault Ste. Marie during the year.

The total production in electric furnace plants during 1913 was 8,075 short tons of ferro-alloys valued at $493,018. In 1912 the production was 7,834 short tons valued at $465,225, and in 1911, 7,507 short tons valued at $376,404.

The imports of ferro-silicon, ferro-manganese, etc., during the calendar year 1913 were 30,355 tons valued at $940,-443, or an average of $30.98. The imports for the calendar year 1912 were 19,810 tons valued at $469,884, or an average of $23.72 per ton; and in 1911, 17,226 tons valued at $429,465, or an average of $24.93 per ton.

### Consumption of Pig-Iron.

An estimate of the total consumption of pig-iron and ferro-alloys in Canada may be arrived at on the basis of the record of production, imports and exports. The total production of pig-iron in 1913 was 1,128,967 short tons, and of ferro-alloys 8,075 tons. The imports of these products during the same period were 267,124 tons, and the exports 6,326 tons. The deduced consumption of pig-iron and ferro-alloys was approximately 1,397,840 tons. Of this amount, 943,130 tons were used in steel furnaces in the production of steel, leaving 454,710 tons for foundry and other uses.

### Steel.

The production of steel ingots and castings in 1913 was 1,168,993 tons, as compared with 957,681 tons in 1912, and 882,396 tons in 1911. In 1913 the production of open-hearth ingots was reported as 824,818 tons; Bessemer ingots, 301,932 tons; direct open-hearth castings, 39,217 tons; and other steels, 3,026 tons. The total increase in production over 1912 was 211,312 tons, or about 22.06 per cent.

The total quantity of pig-iron used in steel furnaces during the year 1913 was 913,722 tons, of which 860,360 tons were produced by firms reporting, and 53,362 tons purchased. The quantity of ferro-alloys used was 29,408 tons purchased. Scrap, etc., was used to the extent of 406,403 tons, being 277,509 tons produced by the firms reporting, and 128,-894 tons purchased. Ores used included 1,342 tons of manganese ore and 55,018 tons of iron ore, while 197,028 tons of limestone or dolomite flux were used, and 10,687 tons of fluorspar. In Ontario, a little over 413,000,000 cubic feet of natural gas were used, while in Nova Scotia coke-oven gas was used at Sydney, of which a record of quantity was not obtained.

In 1912, the total quantity of pig-iron used in steel furnaces was 735,559 tons, of which 706,895 tons were produced by firms reporting, and 28,664 tons purchased. The quantity of ferro-alloys used was 24,237 tons purchased. Scrap, etc., was used to the extent of 336,265 tons, being 223,404 tons produced by the firms reporting, and 112,861 tons purchased. Ores used included 985 tons of manganese ore, and 43,006 tons of iron ore, while 148,045 tons of limestone or dolomite flux were used, and 9,709 tons of fluorspar. In Ontario, a little over 423 million cubic feet of natural gas were used. The following is a list of firms making steel in Canada:—

### Steel Producing Firms.

Dominion Iron and Steel Co., Sydney, N.S.

Nova Scotia Steel and Coal Co., New Glasgow, N.S.

Canadian Steel Foundries, Ltd., Montreal, Que.

Beauchemin et Fils, Sorel, Que.

The Algoma Steel Corporation, Sault Ste. Marie, Ont.

The Steel Company of Canada, Ltd., Hamilton, Ont.

The Dominion Steel Foundry Co., Hamilton, Ont.

The Wm. Kennedy & Sons, Ltd., Owen Sound, Ont.

The Moffat Irving Steel Works, Ltd. (Electric), Toronto, Ont.

**Rolled Products, etc.**—Complete statistics of the production of rolled products and of manufactured steel have not been received; returns from several of the largest producers, however, show a production of blooms, billets, slabs, etc., of 1,134,277 tons, of which 1,098,877 tons were used by the producer for further manufacture, and 35,400 tons sold to other rolling mills.

The production of rails was 554,481 tons; of rods, 57,389 tons; of bars, 266,915 tons; and of other rolled products, 53,835 tons. The production of steel rails in 1912 was returned as 471,422 tons, and in 1911 399,760 tons.

### Exports and Imports of Iron and Steel Goods.

The exports of iron and steel from Canada consist chiefly of manufactured goods, such as agricultural implements, automobiles, bicycles, machinery, etc. Compared with the value of imports, the total value of the exports is small, amounting to not more than 10 per cent. of the former. The total value of iron and steel exported during the calendar year 1913 was $13,999,149, as compared with a value of exports in 1912 of $10,682,484, and in 1911 of $9,907,281. The exports during 1913 included: pig-iron and ferro-products, etc., to the value of $351,646; crude iron and steel valued at $483,813; stoves, gas buoys, castings, machinery, hardware, etc., valued at $1,070,476; steel and manufactures of steel, $1,051,004; agricultural implements, $7,411,246; automobiles and bicycles, $3,630,964.

The exports during 1912 in similar grouping were: pig-iron and ferro-products, etc., $310,702; scrap iron and steel, $145,250; stoves, gas buoys, castings, machinery, hardware, etc., $1,290,762; steel and manufactures of steel, $785,731; agricultural implements, $5,967,545; automobiles and bicycles, $2,182,494.

The total value of the imports of iron and steel goods during the calendar year 1913 was $141,272,357, as compared with a value of $144,400,949 imported during the fiscal year ending March, 1913, and a value of $102,568,832 imported during the fiscal year ending March, 1912. The total value of the imports during the fiscal year 1911 was $85,319,541, and during the fiscal year 1910, $59,952,197.

The rapid growth in imports of iron and steel is thus clearly shown in this statistical record. It will be observed, however, that there has apparently been a check to these imports during the last nine months of 1913, there having been a falling off in the total imports during the twelve months ending December, 1913, as compared with the twelve months ending March of the same year.

The imports during the twelve months ending December, 1913, subject to duty were valued at $125,082,378, the imports duty free during the same period being valued at $16,189,979, making a total value of $141,272,357. The imports during the fiscal year ending March, 1913, subject to duty were valued at $129,131,275, and the imports duty free during the same period were valued at $15,269,674, making a total of $144,400,949. These imports include all classes of iron and steel goods manufactured as well as those of the cruder form.

**ALL FOR NATION'S SAFETY.**

**"It should be plain to everyone that in the stress of danger to the life of any nation at war, the courts should be exceedingly careful not to hamper the actions of those expressly charged with the safety of the nation; careful, among other things, not to take up the time and attention of those who should be fighting the enemy in the field, in fighting law suits in the law courts over private rights. It is not a time when the prisoner is to have the benefit of the doubt: it is a time when in all things, great and small, the country must have every possible advantage."—Chief Justice R. M. Meredith.**

There were imported during the twelve months ending December, 1913, 1,832,475 tons of iron and steel goods valued at $55,927,607, or an average value per ton of $30.52, together with other iron and steel goods of which the quantities are not stated, valued at $85,344,750. During the twelve months ending March, 1913, there were imported 1,875,172 tons of iron and steel goods valued at $53,239,212, or an average of $28.39 per ton, together with other manufactures of iron and steel of which the quantity is not stated, valued at $91,161,737.

The imports of pig-iron have varied considerably during the past six years and the imports in 1913 are not very much larger than those of 1908. The imports of ferro-products and chrome steel have increased during six years by over 90 per cent. The imports of ingots, blooms, billets and puddled bars have more than doubled in that period. The imports of scrap iron and scrap steel show an increase of about 40 per cent. in the six years. The imports of plates and sheets, and of bars, rods, hoops, bands, etc., were nearly three times as great in 1913 as in 1908. The imports of structural iron and steel have increased steadily since 1909, but were larger in 1908 than in any other year of this period, with the exception of 1913. The imports of steel rails, pipe and fittings, nails and spikes, iron forgings, castings, and manufactures have varied considerably, but reached a maximum in 1913.

A very large proportion of these imports is derived from the United States, records published in the "Commerce and Navigation of the United States" showing the exports of iron and steel goods from that country to Canada. According to this authority there were exported to Canada from the United States during the twelve months ending June 30, 1913, 1,695,916 tons of iron and steel goods valued at $51,936,616, together with other iron and steel goods of which the weight is not given, valued at $54,053,014, or a total value of imports from the United States of $105,989,630.

During the twelve months ending June 30, 1912, the corresponding exports to Canada were 1,175,464 tons valued at $36,637,305, together with other iron and steel goods valued at $46,020,989, or a total value during the year of $82,658,294.

### NICKEL-PLATING ALUMINUM.

A communication has recently been presented to the Academie des Sciences by M. Le Chatelier, in which the author states that he has succeeded in nickel-plating aluminum, hitherto unaccomplished. This has considerably prevented the extension of employment of this metal, which lends itself to so many purposes, since its dull appearance, especially after prolonged use, has been much against it. The difficulty has been surmounted by a preliminary scouring of the aluminum in a bath of hydrochloric acid containing iron. The iron precipitated on the surface of the aluminium forms a kind of network, and when the piece of metal is then passed into the nickel bath, the nickel becomes fastened in this network and adheres strongly to the aluminium.

**Industrial Peace Prevails**—Industrial peace prevails in Canada at the present time, only one conciliation board having been constituted lately, to deal with a dispute between the city of Edmonton and its electrical employees, Judge Hyndman is chairman.

# Relative to Cam Grinding and Cam Grinding Equipment--III.

By Howard W. Dunbar.

*The purpose of this series of articles is to describe as clearly as possible the methods employed by the Norton Grinding Co., Worcester, Mass., in the production of the master cams which are used for cam grinding. There are doubtless many of our readers whose knowledge of the subject will be materially increased thereby. Text and cuts, courtesy Norton Co.*

BRIEFLY, the production of master cams is accomplished by reversing the operation of grinding the cam shaft. In place of the large grinding wheel on the machine is a plain disc of exactly the same diameter as the wheel, and in place of the roll which the master cams operate against is a grinding wheel of the same diameter as the roll, suitable means being provided to drive the wheel at the proper speed.

In Fig. 1 is illustrated this operation, using the cam grinding attachment in which the cam shafts are to be ground. The disc is shown at (2) bearing against the model cam shaft (4) mounted on the centres of the attachment, and driven by dog (3). The wheel for grinding the masters is shown at (1), carried on a special spindle provided with a pulley and belt for driving the wheel. The hardened master cams (5) previously roughed to the approximate form are mounted on the master cam spindle ready for the grinding operation. The bearings of the master cam spindle and the centres of the attachment lie exactly in line. As the spindle, wheel and disc revolve, the shape of the model cam as it bears against the disc on the wheel spindle gives an oscillatory motion to the attachment, reproducing on the master cam blanks a shape which will produce cam shafts exactly like the models.

### Master Cam Grinding Feed.

In order to provide for a feed in grinding the masters, the operation is exactly the reverse of that ordinarily used in grinding machines. In other words, instead of feeding the wheel slide towards the operator it is fed away from the operator. It will, therefore, be seen that in first starting to grind the masters, the disc must be brought in towards the operator far enough to force the attachment which carries the master cam blanks to swing away from the grinding wheel (which has a fixed position in relation to the centre line of the pivots of the attachment) far enough to allow the starting of the grinding operation and, as this proceeds, to gradually move the wheel slide back until the desired shape is produced. This position is governed by the smallest master on the spindle. When this has been ground and "cleaned up" around the entire periphery, a reading is taken on the index, and thus is determined the position to stop for all blanks. The same procedure is followed in grinding masters for loose cams, and as illustrated by Fig. 2, the elements being numbered the same as in Fig. 1.

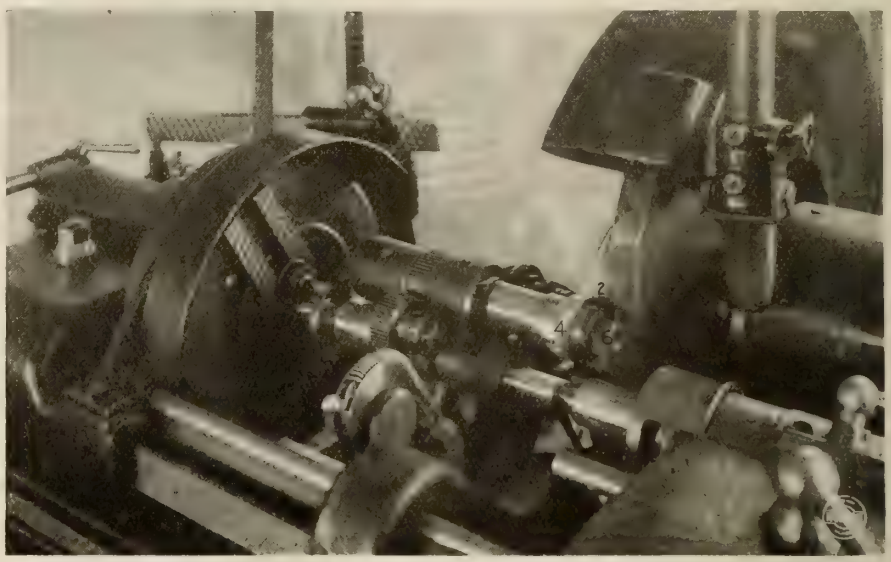

FIGURE 2.

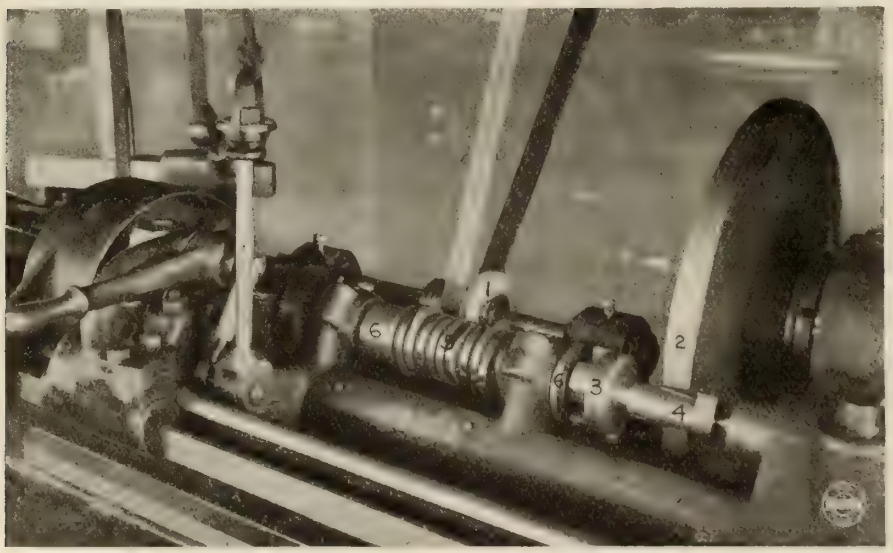

FIGURE 1.

### Marking the Soft Blanks.

An interesting operation in the grinding of masters is the method used in marking the soft blanks preparatory to roughing down to the approximate contour. This is accomplished by mounting all the blanks on the roughing master cam spindle, and allowing the small grinding wheel to bear on the side of the blank, as illustrated in Fig. 3 on page 11. Otherwise the fixture is set us as though ready to grind master cams. As the machine is started, the model produces the required motion in the fixture as it bears against the disc on the wheel spindle, to describe a line on the side of the blank with the rapidly revolving grinding wheel, which approaches the correct contour of the cam outline.

To accomplish this it is necessary to start with the extreme high point on the tip of the model cam bearing against the disc, and allow it to make one complete revolution, coming back to this same point. This operation is repeated for each cam to be ground, after which they are removed from the spindle and formed to this rough outline and hardened. After hardening, and after grinding the keyways with a special fixture to fit the regular master cam spindle, the holes are ground. During this operation of mark-

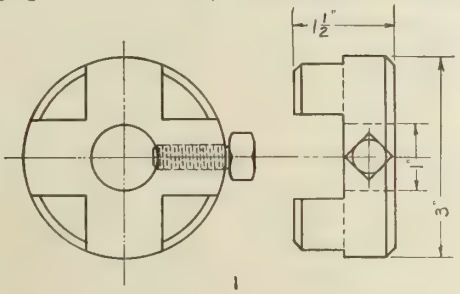
ing the cams, the wheel slide must remain in the one position, determined by the first outline marked.

With a set of model cams completed, which, when carefully inspected and tested comply with all of the requirements, we are ready to take up the grinding of master cams and, to successfully accomplish this, requires slight changes in the setting up of the machine, as described later, and makes necessary the following equipment:

Grinding wheel bracket with 4 in. diameter grinding wheel, arbor and sleeve.
Model disc.
Model cam driving dog.
Set of master cam blanks.
Roughing master cam spindle.
Regular master cam spindle.
Inspection machine.

### Grinding Wheel Bracket, etc.

These parts replace and occupy the same position as the roll bracket on the integral cam grinding attachment, and are provided with means for driving, independent of the attachment drive. This may be accomplished by either jack shaft, or motor, and pulleys. It is generally placed towards the rear of the machine and in such a position that the direction of the belt will be in a line about 45° from the horizontal. It is important that the driving drum be at least 10 in. long to allow for the positioning of the small grinding wheel in front of the various master cam blanks to be ground, and also to allow for a sufficient amount of table travel to place the large disc in front of the model cams.



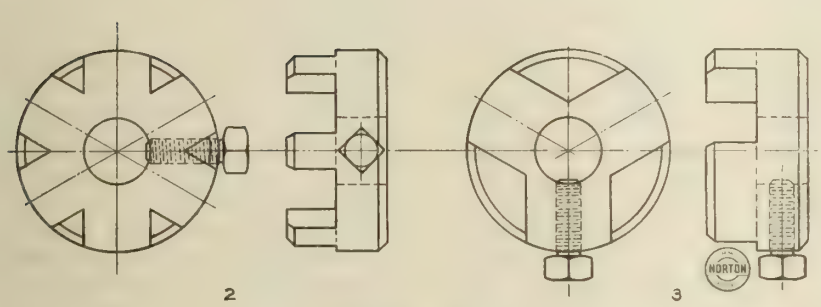


FIG. 4. MODEL CAM DRIVING DOGS.

### Model Disc.

This is known as the model disc because it is used in place of the grinding wheel, and bears against the models, giving the motion to the attachment which forms the correct shape on the masters. It is very important that this be of the exact diameter of the grinding wheel to be used in cam shaft grinding, which in all attachments (except the No. 1 individual) is 18 inches. It is used in position on the end of the wheel spindle of the machine, and is revolved by the friction between it and the model cam.

### Model Cam Driving Dog.

Several styles of model cam driving dogs are used, and all have their special purpose. Too much importance cannot be placed on the relationship of the driving dog to the model cam shaft, as this is a very important item, and on it largely depends the accuracy of positions the masters bear to each other. The model cam driving dog must bear exactly the same relation to the cams on the model cam shaft as the regular driving dog bears to the cam shafts in the cam grinding operation.

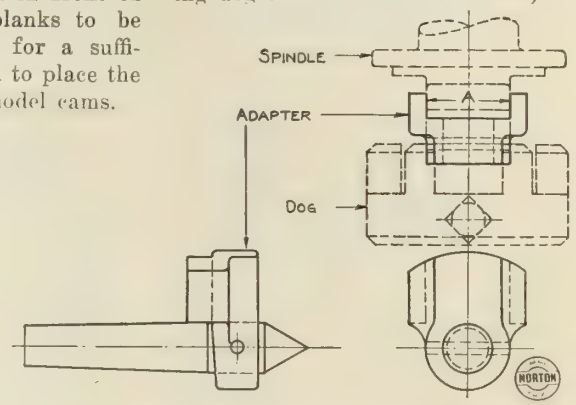

FIG. 5. DRIVING ADAPTER.

Fig. 4 shows the general types of dogs used for one, two, four and six-cylinder cam shafts. No. 1 is designed for a one, two or four-cylinder shaft. It will be noticed that the slots which engage the driving prong on the fixture are spaced 90° apart. Once the dog is attached to the shaft it should never be moved until the grinding operation is completed, indexing being taken care of by the slots above mentioned.

The dog marked No. 2 is used for a six-cylinder shaft, but because of the narrowness of the slots it is necessary to use an adapter for driving, which will fit into the slots and engage the driving projection on the attachment. This adapter is illustrated by Fig. 5, in which

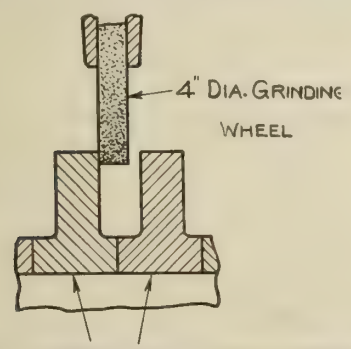

FIG. 3. MASTER CAM BLANKS, METHOD OF MARKING.

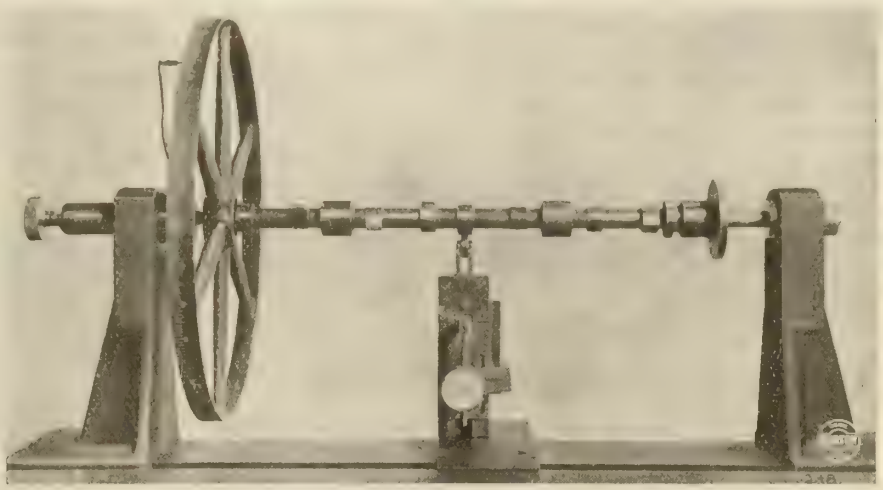

CAM INSPECTION FIXTURE.

the master cam dog is dotted in position, and the adapter engages the driving projection on the master cam spindle at "A." The use of this adapter is overcome by dog marked No. 3, but it has an objection, as it is necessary to move this dog 180° on the model cam shaft in order to grind all the masters required on a six-cylinder cam shaft. This, of course, makes it necessary to use an inspecting machine such as previously described, and mentioned briefly later.

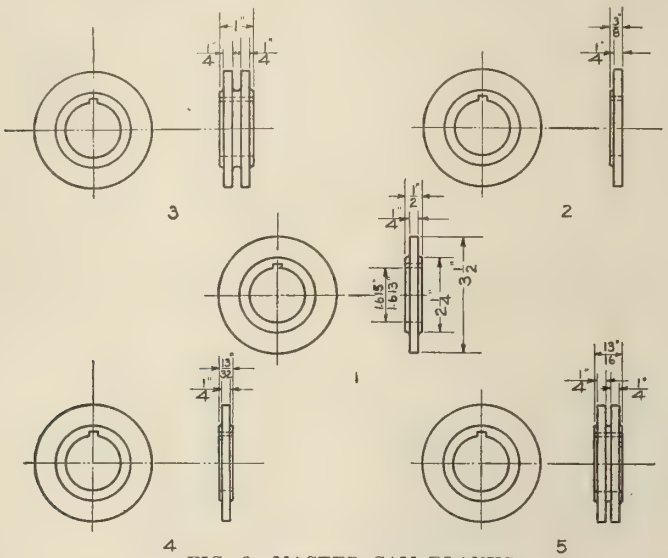

FIG. 6. MASTER CAM BLANKS.

### Set of Master Cam Blanks.

Master cam blanks are made of an exceptionally good grade of steel and carefully hardened to give the best wearing surface possible, in order to insure that they keep their shape for a long time. The number of cam blanks is always determined by the number of cams on the cam shaft to be ground, one blank being provided for each cam, auxiliary or eccentric. The attachment is limited to fourteen in number, and on this, and various other conditions, depends the type of blank used, all of which are illustrated in Fig. 6.

No. 1 blank is used when there are from one to eleven master cams on the spindle, none of which are to be used for the production of auxiliary cams.

No. 2 blank is used for the twelfth cam when there are twelve cams on the spindle, the first eleven being made like blank No. 1. This twelfth blank is always placed nearest the threaded end of the spindle.

When there is an auxiliary or relief cam to be ground, and not more than twelve masters are to be mounted, a double blank is used, as shown by No. 3. The auxiliary master cam is formed on one side, and the master cam, with which the auxiliary is associated, on the other. For all other cams which do not have auxiliary cams associated with them, blanks No. 1 and 2 are used, the conditions governing their use being the same as previously described.

When more than twelve and not more than fourteen cams are to be ground, blanks No. 4 and 5 are used, the conditions of their use being the same as treated under blanks No. 1 and 3. Where double master cam blanks are used they are always considered as two blanks when determining the number of master cams to be mounted.

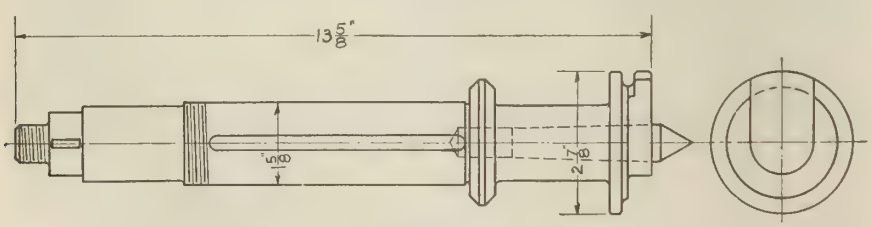

FIG. 7. MASTER CAM SPINDLE.

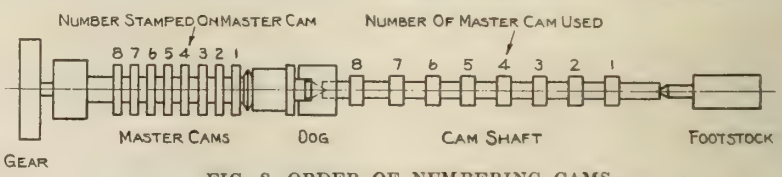

FIG. 8. ORDER OF NUMBERING CAMS.

**Submarine Construction in Montreal.**—We are advised by the Department of Militia and Defence at Ottawa, that they gave no authorization to the statement contained in a Montreal newspaper, and which was reproduced by us relative to submarine construction in progress at the plant of Canadian Vickers, Ltd.

## DOMINION STEEL PRESIDENT ON OUTLOOK.

THAT there is a fair amount of business offering in Europe for the Canadian steel companies, but that they are considerably hampered in handling it owing to the difficulty of getting steamers to transport their freight across the Atlantic, is the statement made by J. H. Plummer, president of the Dominion Steel Corporation, who has just returned from an inspection trip to the company's plants at Sydney.

"As regards our European business, conditions are very fair," said Mr. Plummer. "The trouble is that there is not much margin of profit in it, and that, because the British and French Governments have commandeered so many vessels, it is difficult to get shipping space. The result is that, although prices on steel and iron products in Europe have recovered from their recent depression, the increased cost of transportation to market offsets the higher quotations."

Mr. Plummer reports that the steel business in this country has not shown any improvement as yet, reflecting in this respect general trade conditions. Furthermore, he states that, in view of the unprecedented circumstances, it is exceedingly difficult to make any warranted deductions concerning the outlook.

The Dominion Steel Corporation is now operating between 66 2-3 per cent. and 75 per cent. of capacity, and is employing between 2,600 and 2,800 men. The employes are not all working full time, but the labor situation has improved in the last few months because of the European orders received.

**Graphitized Metal.**—Injecting molten metal into graphite by air pressure gives a new product, known as "graphalloy," which has hardness and strength adapting it to many purposes, and retaining the lubricating property of the graphite. The new material is intended especially for bearings for light machinery, such as small motors, fans and windmills. The metal or alloy used with the graphite can be varied to meet the requirements of any particular use—bronze being most suitable for trolley-wheel bushings, for instance, and copper or copper alloys for electrical apparatus. The graphalloy can be machined into any desired form.

# Case and Surface Hardening by the Oxy-Acetylene Process

By C. Royer*

*The oxy-acetylene process of rapid heating of machine parts for various purposes is being very generally adopted, not only on account of its wide range of usefulness, but because of the simplicity and portability of the apparatus required and the decreasing cost of the gases used. The two newer applications herein described represent an important development.*

WHILE the oxy-acetylene flame has come to be an almost indispensable adjunct of the repair shop, where it lends itself equally well to welding broken parts, building up worn parts, cutting metals, melting lead out of pipe joints, taking apart of shrink fits and many other uses, its application to manufacturing has been somewhat slower though none the less certain and far-reaching. The oxy-acetylene blow pipe furnishes a highly concentrated and very intense source of heat which permits local heating in such good conductors of heat as copper and aluminum, these metals now being successfully welded by this process.

### Local Hardening.

The local hardening of tool steel, particularly the high speed varieties, and the case hardening of mild steels opens up a comparatively new sphere for the employment of the oxy-acetylene blow-pipe which, as the methods become better known, bids fair to become very important. The most aggressive experimenters in this line are perhaps the French Association of Autogenous Welding whose tests have proved conclusively that the blow-pipe can be used with advantage for case hardening.

It is unlikely that this process will replace, to any extent, that, at present in use but case hardening will now be available to many classes of work heretofore decidedly out of its range of application.. Large pieces requiring but a small hardened area can be successfully treated by heating scarcely more than the surface to be hardened and the consequent expense, warping, and other difficulties incurred by heating the large mass in a coke fire or furnace is obviated. Also, parts already assembled in machines whose removal would entail taking down a large part of the mechanism, can be hardened in place without danger to other parts, the process being so rapid that the heating is purely local and has little time to be transmitted to other parts of the work.

### Orthodox Case Hardening.

Case hardening, as is ordinarily practised, consists of carburizing the outside shell of a mill steel casting or forging, thus transforming the outside skin to a high carbon steel which hardens easily upon being quenched. This result is obtained by heating the steel and keeping it, for a certain time, in contact with red hot charcoal or other carburizing substance. The metal absorbs more or less carbon, which absorption is much more rapid if the steel already has some carbon in its composition. Some elements such as nickel and manganese also facilitate the absorption of carbon while, on the contrary, certain impurities such as slag retard the penetration of the hardening substance. For this reason, where good or deep hardening is desired, only the best and purest qualities of steel should be used. About one-half of one per cent. of nickel also gives excellent results.

The rapidity of the process and the depth of penetration depend upon the temperature, and the quality of the case hardening is shown by the depth of the hardened surface. Also, as the percentage of carbon varies from the outside to inside of the surface layer, it is also necessary to take into account the maximum and medium percentages throughout. Case hardening well done should affect a sufficient thickness of the metal treated, and the amount of carbon should decrease gradually from the outside to the inside and should not consist of a film of hard metal without a gradual transition to the condition of the original metal.

### The Surface Feature.

When the process is carried out in a closed vessel by means of animal charcoal, carbonate of baryum, cyanide or other organic matter, a very hard and resisting surface is obtained which will not split or shell off because by this method, the decrease of hardness from the surface inward is very gradual and regular. On the other hand, a surface produced by rubbing on the red hot metal, a powder, generally containing ferro cyanide of potassium, gives a very hard thin skin which is liable to flake away during hardening or in service.

The use of the blow-pipe permits the obtaining of either of the above results at the will of the operator by means of suitable handling of the instrument. By using a well-regulated flame to heat the steel and afterwards giving a slight excess of acetylene, one can obtain quick, deep case hardening but it is essential that the inside tip of the flame be kept at a distance of at least one inch from the surface being treated. Being so regulated, the flame contains an excess of free carbon which is very easily absorbed by the metal which is being kept hot by the flame. Again, by keeping the inside tip of the flame too near the part to be heated, a very hard and thin layer of high carbon steel is obtained which is liable to flake away.

### Blow Pipe Results.

The following results have been obtained by experiment but, in all cases, care was taken to keep the piece, while being treated, at a cherry-red heat. By the white, inside cone of the flame being kept for two minutes at a distance of five-eighths of an inch from the surface of a piece of open hearth steel, a hardened layer was obtained 0.0197 inch thick and the surface of the metal gave, upon analysis, 2 per cent. of carbon. This is approximately the same condition as is obtained by the use of a chemical powder.

By maintaining the inside flame of the blow-pipe with an excess of acetylene, at a distance of 1¼ inches from the surface of the same metal for a period of 10 minutes, the depth affected was found to be 0.1181 inch and the maximum percentage of carbon, that in the outside surface, was not more than 0.85. From this it is evident that, to obtain a deep and evenly graduated treatment, care should be taken to hold the flame far enough from the surface being treated. Otherwise the surface is liable to be transformed into a kind of white cast iron, which is very hard and brittle, and is liable to flake off in the hardening process. It is, therefore, evident that any desired degree of hardness or toughness can be obtained in case-hardening by the oxy-acetylene process by varying the distance at which the flame is kept from the work and the time during which the surface is exposed to the carbonizing flame.

### Tool Steel Surface Hardening.

The use of the blow pipe for case-hardening mild steel should not be confused with its application to the surface or local hardening of high carbon and high-speed steel. In the former case the heat of blow pipe is used to maintain the metal treated at a high temperature,

*Manager, L'Air Liquide Society, Montreal.

while, at the same time, the purposely-produced excess of carbon in the flame changes the chemical composition of the steel. In the latter application only the rapid heating power of the flame is utilized as a convenient method of heating a small portion of the surface of a piece of steel, while the rest of the metal is being kept cool by running water or other method.

Surface hardening has received a great deal of attention in England at the works of Messrs. Vickers & Maxim, and has proved to be a cheap and rapid method for the treatment of the wearing surfaces of steel parts. It is applicable to the hardening of the surface of gear teeth, cast steel shafts and boxes, templet holes, and, in general, to the hardening of any small areas upon the surface of large articles, especially in cases where the ordinary process of heating and hardening would cause distortion that would be difficult to remove by subsequent grinding. The lack of warping forms one of the chief advantages of the process. The metal is only heated to slight depth; the surface is cooled as fast as heated, and a very small area is in the heated condition at a single time.

The work to be hardened locally is placed in a tank of water, so that, if possible, the water covers all except the small surface being operated upon. If this is not convenient, it is often quite possible to arrange a stream of water from a hose so as to keep running water on the surfaces which it is desired to keep cool. The flame used should be powerful, and should be held close to the part to be hardened. The flame is directed so that the outer portion flows in the direction along which the blow pipe is being moved. The cooling water is made to follow as closely as possible without interfering with the flame and thus prevent heating.

### Speed of Heating.

Special care should be given to the speed of heating and movement of the burner. As the flame passes along, it quickly heats up the surface, which is instantly cooled by the water or by the cold surrounding body of metal, leaving it at the maximum hardness to be obtained with that material. To secure a thin but intensely hard surface, the part to be treated should be barely covered by the water, and the force of the flame should blow the film of water away from the part being heated. This is done by increasing the oxygen pressure.

The normal treatment gives a hard surface about 1-16 inch deep, but greater depth can be obtained by prolonging the heating without burning or oxidizing the surface. This is easily accomplished by moving the flame slightly but rapidly back and forth over the part so that a larger area is heated at once. Experience has shown that no matter how thin or how hard the surface layer produced, it shows no tendency to flake off from the body of the piece.

The process is carried out with the ordinary oxy-acetylene welding outfit fitted with different sizes of blow pipes, care being taken not to employ an oxidizing flame. It is claimed that even cast iron and some kinds of malleable iron can be greatly improved in the degree of surface hardness by being subjected to the same treatment.

The number of uses to which the great heat of the oxy-acetylene flames can be put has grown more rapidly perhaps than the similar development of any other apparatus. The two particular applications above described will, no doubt, open up large fields within themselves and the oxy-acetylene welding apparatus will become more and more an essential part of the modern manufacturing institution, where it will enjoy the same prominence it has held for some time past in the repair plant.

## THE "FORD" IDEA.

IN his formal statement constituting replies to a number of written questions submitted by the Federal Commission on Industrial Relations, Henry Ford, president of the Ford Motor Co., of Detroit, Mich., and Walkerville, Ont.. made a number of observations relative to his enterprize as well as on employer and employee relationship, the latter of which are of more than ordinary interest. Mr. Ford stated that eight members constitute the company, that its capitalization is $2,000,000, and that last year it did a gross business of between $80,000,000 and $90,000,000, with profits of about $25,000,000. Among others, the following references apply to the employer and employee relationship feature:—

No man can bring up a family and hope to own a home on the ordinary rates of wages.

I do not think any man can do good work mentally and physically for more than eight hours per day.

Theoretically, some persons may argue that we have no right to inquire how a man lives at home, so long as he does his work at the factory, but we are talking of conditions, not of theories. Our experience leads us to conclude, beyond doubt, that the interest taken in employees as to their individual welfare, is most desirable from every standpoint, not only that of the employee and his family, but of the business itself.

The ever-increasing interest developed in our plan by other employers of labor and the individual expressions of the men themselves, which we have taken great pains to learn from disinterested sources, further prove the correctness of our views.

Any manufacturing institution that is successfully making a single product, should increase the business and its plant, and make more work to employ more men.

We cannot expect a man to give us his best efforts when he is in debt and has not enough to keep his family on.

If corporations are over-capitalized they must necessarily oppress labor to make a showing, but if they grow from small beginning, naturally, and stick to one legitimate product, balanced conditions are bound to follow.

The sooner men can be taught that labor is just as much of an asset, and more than machinery and buildings, the sooner labor will be properly recognized.

In my judgment mere business is no objection if corporations are not over-capitalized.

We believe it is better, wiser and more just to make many men comfortable than to make a few very rich.

I have very little use for charities or philanthropies as such. My idea is aid to men to help themselves. Nearly all are willing to work for adequate reward. We have all kinds of cripples in our employ, and they are making good. We have a great many who have been in prison and who are outcasts from society. Every one is making good.

### Tariff and Competition.

Speaking also before the commission, Geo. W. Perkins, of the U.S. Steel Corporation, denounced the tariff. He said, "To it is due the depression in the steel industry, as well as in other industries. We need a tariff on a non-political basis," he said. Speaking on the broader aspects of business, Mr. Perkins said:

"I do not believe that competition is any longer the life of trade. Competition, driven to its logical end, gave us the sweatshop, child labor, long hours of labor, unsanitary labor conditions, and bred strife between employer and employee.

"For every ounce of trouble brought about in industry through the selfishness and cupidity of business men a pound of trouble has been brought about through half-baked laws and muttonhead legislation."

**F. C. Gamble**, chief engineer of railways for the B. C. Provincial Government, has been elected president of the Canadian Society of Civil Engineers for the year 1915. This is the first appointment of a western member to the presidency of the society, and it will be recognized as a mark of appreciation of Mr. Gamble's untiring work for the advancement and elevation of the profession in Canada.

# PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

## DRILL JIG FOR STEEL COLLARS.

By James E. Cooley.

DRILLING and tapping out the screw-holes in the steel collars, so extensively used on studs and small shafts, etc., has always been done by a more or less wasteful method. The type of jig most generally used for the operation is made from an angle plate, having a plug fastened in it, on which the single steel collar is placed to be drilled and tapped. A steel piece, containing a drill bushing is screwed on the plate to guide the tap drill. After the holes are drilled the collars are washed, and then the holes are tapped out. This necessitates a second handling of the collars, and each separate handling, of course, adds to the expense in their manufacture.

In the enclosed drawing is shown a box jig for drilling and tapping the screw holes in the several collars shown assembled there, also in which the headless screw is placed in the collars in the course of these operations. This jig is used in connection with a four-spindle multiple drilling machine, or a drill press using interchangeable collets and tapping fixture. Three views of the jig are shown; the one in elevation shows eight steel collars held in place by a shoe A and set screw B. A cover C containing the drill bushings is fastened to the sides of the jig by the screws D, on which it is made to swing over, as shown by the dotted lines E, and rests on the pins F. This is necessary in order to have the bushings out of the way when the holes are being tapped out. A button G holds the cover C down on the edge of the jig at C1.

### Operation Features.

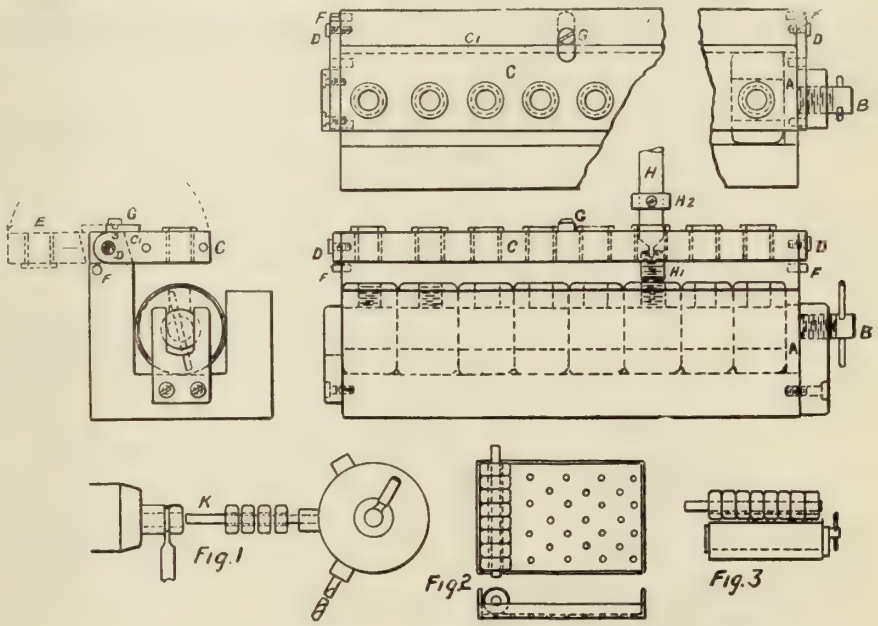
The construction of the jig can be easily followed without further instructions, but brief descriptions are given concerning the drilling and tapping of the screw holes, order of operations, etc., and also directions to follow in connection with other minor operations in order to produce all the work on the collars quickly, and with the least waste of time. The holes in the drill bushings are made 1-64 in. larger than the screw. The purpose of this is that when the hole is tapped out, a slight burr is made by the top thread on the outside diameter of the collar, and this has to be filed off. If a spotting is made on the collar, the full depth of the point of a drill 1-64 in. larger than the screw, there will be no burr there after the hole is tapped. This does away with one slow operation—that of filing off the burr by hand.

Assuming that a four-spindle multiple drill be used, it is set up as follows:—The first spindle contains a drill for spotting; the next spindle, the tap-size drill; the next, the tapping fixture, and the last spindle, a screw-driver as H held in a chuck. The first operation is to spot all the collars; the next is to drill the holes, the jig still retaining the collars is then dipped in a pail of hot soda and the chips washed out. The button G is turned around, the cover C swung back, and the holes tapped out. Again, the jig with collars are dipped in the soda, and the chips from the tappings are washed out; the cover C is swung forward in position, and headless screws are dropped in each drill bushing, as at H1. The screw-driver is next placed in the bushings, engaging with the slot and sending the screw down in the collar. A stop collar as H2 on the screw-driver regulates the depth for inserting the screw, and the latter should enter down in the collar, within one thread of the shaft-hole.

When these operations are completed, the collars are emptied out of the jig, being finished with but one exception, viz., removal of a burr made by the tap on the inside of the shaft-hole. This is accomplished in a separate operation by reaming out the burr on the drill press. It is the only instance where the collars are handled separately, but the work can be done very rapidly. The whole cutting length of the reamer should not be put in the hole, only just enough of it to remove the burr. Generally the latter is filed out by hand, also the edges of the shaft-hole are scraped, as a burr is made when the collar is cut from the bar. The reamer eliminates all these operations.

The collars are not taken from a work-box and placed in the jig one at a time, a quicker arrangement than this can be provided. As fast as a collar is cut from the bar after the shaft-hole has been drilled and reamed, as in Fig. 1, they are slipped along on the rod K, which is placed in the turret-head for the purpose. When the rod is filled, it is taken out and the collars are placed in the perforated tray shown in Fig. 2. When the tray has become filled with collars it is dipped in the soda water to remove the oil and chips. The collars being still retained in the tray, are carried to the drill press, the rod being inserted through a row of them for the purpose. They are then placed in the jig and the rod removed, as suggested at Fig. 3. One tray will hold a considerable number of collars.

The rod in the turret-head should not be fastened with a screw, as this takes time to undo. The length of the jig, or the number of collars to be contained therein, will be determined by the thickness of the collars. When cutting the collars from the bar, much time will be saved if more than one cutting-off is used.



DRILL JIG FOR STEEL COLLARS.

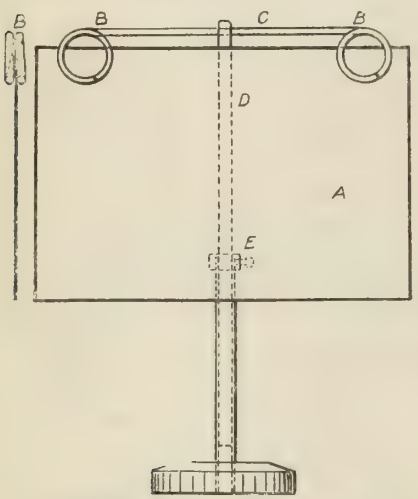
## DRAWING SHEET HOLDER.

By E. C. James.

ONE cannot help but notice how carelessly shop drawings and blueprints used by workmen are handled. They are often seen spread out on work benches, tool boxes, and machinery, and as a consequence are easily soiled and torn. Further, drawings are sometimes lost by being blown out of shop windows, and it is not uncommon to see them lifted up by the wind from the bench and glide down gracefully into a machine pan containing oil.

When blueprints and pencillings are once rolled up, it is a hard matter to keep them opened out, as a matter of fact, weights must be used to hold them out flat.

In the sketch herewith is shown a very convenient means for holding a drawing, and which prevents it getting torn or soiled; saves frequent handling and in



DRAWING SHEET HOLDER.

addition has the advantage that the holder can be placed where it is most convenient for reading by the workman. The drawing-sheet A is held between two ring-coils B, formed on the ends of the horizontal rod C. This rod is ⅛ inch in diameter, and fits into the vertical adjusting rod D. The vertical rod is ⅜ inch in diameter and slides in a brass tube attached to the cast-iron base shown. A collar E is attached to the tube and contains the set-screw for the rod D.

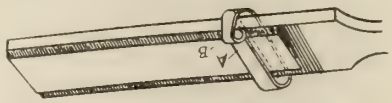
These holders can be made up to suit all sizes of drawing sheets, the rod D being raised or lowered according to the size of the paper to be attached to the holder.

## EMERY CLOTH CLIP.

By C. E. Wyllys.

NEARLY every machinist when polishing a piece of work held in a vise, usually places a strip of emery cloth lengthwise around both sides of a file, and holds the cloth in position with the fingers as the file is pushed forward and back. This method has never been satisfactory as the cloth frequently slips from the file.

In the accompanying drawing is shown a useful clip for holding a piece of emery cloth on to a file. It consists of a strip of sheet steel bent over into the form of a clasp and tempered. When



EMERY CLOTH CLIP.

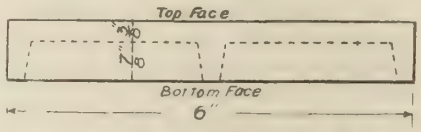
the cloth is placed on the file and drawn tight, the clip is put on and the point A is snapped down over the beaded end B as indicated. To remove the clip, the beaded end B is pushed outward which releases the point A.

## LEVELLING UP LIGHT PLATES.

By D. A. Hampson.

THE little job herein described represents one of those seemingly insignificant undertakings which either bring in a neat profit or cause more trouble and worry than they are worth, according to the success of the method adopted in handling them. The work consisted of planing the top and bottom of a hundred gray iron plates as represented in the accompanying sketch. The average size was about 6 inches square and the same thickness of top and stiffening ribs was used for all.

A variation of only 0.0005 inch in total thickness was allowed and, consequently the metal could not be hogged off, and a roughing cut had to be taken all over before any finishing was done. Before taking the light finishing cut the ribs forming the bottom surface were carefully levelled up by filing and rubbing on a surface plate. To be an accurate job this had to be carefully done, and proved a very tedious job. In spite of all care exercised in the roughing



G. I. PLATE FINISHED ALL OVER

cut, the pieces would rock from 0.003 to 0.004 inch when laid on the plate.

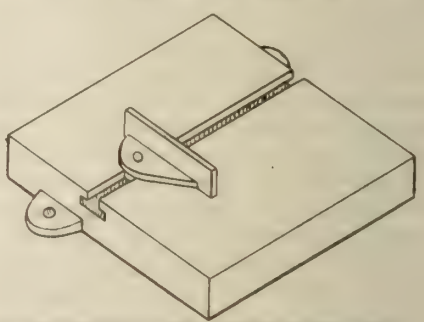
After he had dressed up a few, the machinist on the job grew faint hearted at the magnitude of the task ahead of him and conceived an idea that proved to be a time-saver. Placing the piece in the vise and applying a 24-inch monkey wrench, he found that, after very little practice, he could give it a permanent set that would correct most of the deformity. The castings could be quickly levelled up by this method to within 0.001 inch of being perfectly flat and further, the set thus obtained was not affected by the subsequent finishing cut.

## FALSE TABLE FOR SENSITIVE DRILL.

By A. H. Donald.

THE tables on most sensitive drill presses are rectangular in shape with an unbroken flat surface. A few years of steady service will change this face into one marked by the points of many drills, to say nothing of the holes drilled well into the surface. Continued wear will also cause the table to become convex. In the meantime much time has been spent fastening fixtures with C clamps and other external devices, and in keeping these appliances and preventing them from becoming lost.

After going through these experiences, our firm decided to equip all the sensitive drills with false tables similar to that shown in the sketch. These consisted of light castings well cross-ribbed beneath and having a machined T-slot



FALSE TABLE FOR SENSITIVE DRILL.

across the face. The plate or table is held in place by two top bolts let into the real table in the oil channel section. This false table takes all the wear and effects of rough handling of work and drills, and when it becomes worn or convex it is very easily removed and planed up.

The T-slot is a time-saving feature, and as all the slots are the same, the bolts are interchangeable, and several are kept convenient to each machine for fastening work, jigs or fixtures. Various forms of general labor-saving fixtures can be made at small cost, one of which is shown in place. For instance, a jig set between a couple of these is prevented from dying around and is still free to adjust itself slightly to the movements of the drill. Again, some of our work consists of several holes drilled in a straight line. All that is necessary in this case is to slide the fixture along the groove or, if the work is not clamped, it can be moved along the face of the angle-plate.

# Reducing the Coal Consumption in Factory Power Plants

By H. W. Benton

*The writer of this series of articles sets forth in plain and easily intelligible language his experience of power plant operating conditions in what might be termed over-average progressive manufacturing concerns, and shows conclusively that in almost every installation there is opportunity increasing efficiency without serious disturbance of existing equipment.*

STEAM power machinery has one very great drawback, although not altogether a fault, yet working out to its disadvantage, viz.: the peculiar ability to keep going even when in very bad condition. The apparatus is so "fool-proof" that it will stand much "monkeying with" before it lays down and refuses to go further. This, however, all reflects back to the fuel pile, your coal bill goes away up and you see no visible reason why. To me it is surprising that manufacturers do not awake to the fact that their power cost is too high, and that it can and should be brought down to the lowest possible point, and must be kept there.

### Example I.

There is a steam electric power house not very far from Toronto where the coal bill can be cut to the tune of a few thousand dollars per year, without buying any new machinery, just by making each machine work properly and the whole plant in harmony. The steam generators consist of three 300 h.p. Heine water tubes boilers, fitted with chain grate stokers. Two boilers are fired at a time. The engines, two of which are 17 in. x 34 in. x 36 in., cross compound condensing, are of an excellent type and build, and are direct connected to A. C. generators, each of 450 k.w. The average operating conditions, as shown by the power house daily report to the general office for six days last year, were as follows:—

| Average load on engines per 24-hour day. | Coal used per 24 hours. |
|---|---|
| July 21.. 902 h.p. per hr. | 29.11 tons. |
| Sept. 21.. 828 h.p. per hr. | 31 „ |
| Sept. 22.. 865 h.p. per hr. | 32.10 „ |
| Sept. 23.. 790 h.p. per hr. | 33.14 „ |
| Sept. 24.. 805 h.p. per hr. | 32.11 „ |
| Sept. 25.. 863 h.p. per hr. | 35 „ |

These figures indicate at once their own incorrectness, and that there is something wrong somewhere. How can 902 h.p. per hour be developed for a 24-hour day on 29.11 tons of coal, and on another day only 863 h.p. be developed with 35 tons of coal? Why should it take 33.14 tons for 790 h.p. per hour and only 31 tons for 828 h.p. per hour?

Again, this plant should develop 1 horse-power per hour at the engine on 1¾ to 2 pounds of coal per hour. To be generous, however, let us take 2½ pounds of coal per horse-power hour.

Thus, 790 horse-power per hour would require $\frac{790 \times 2.5 \times 24}{2000} = 23$ tons 14 cwt., or, say, 24 tons of coal.

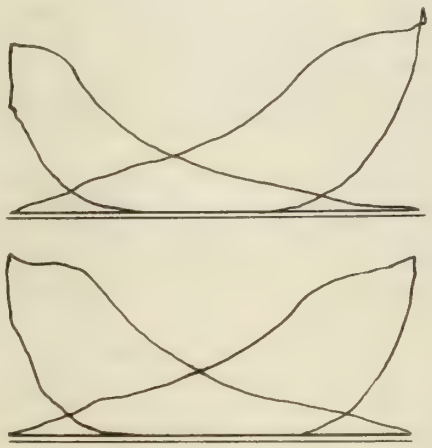


FIG. 1. THE UPPER AND LOWER DIAGRAMS ARE FROM A BROWNELL ENGINE 16 IN. X 24 IN., 175 R.P.M., AND SCALE 50, BEFORE AND AFTER ADJUSTMENT, RESPECTIVELY.

On the particular day, September 23, the report shows coal used as being 33.14 tons. Subtracting the actual coal required as above, 23.14, we get wasted coal amounting to 10 tons, which at $3 per ton means $30 per day, and $900 per month.

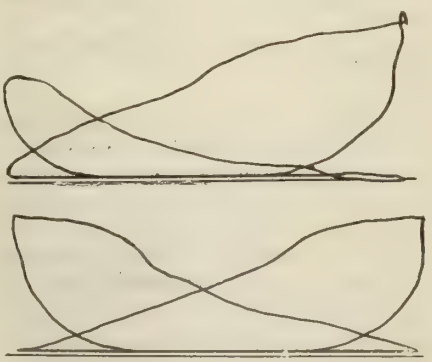

FIG. 2. THE UPPER AND LOWER DIAGRAMS ARE FROM AN ERIE CITY ENGINE, 10 IN. X 12 IN., 120 R.P.M., AND SCALE 50, BEFORE AND AFTER ADJUSTMENT, RESPECTIVELY.

An expense of $1,500 or less would put this plant in A1 shape to develop power economically, and still the owners pay the coal bill as though there was no other thing to do. Less than two months' savings of coal would pay all expenses, and the savings would continue for several years.

### Example II.

Some time ago I was called to a woodworking factory driven by a Wheelock engine that was only six years old, but, to look at it, one would think it had seen thirty years of abuse. They told me the engine was overloaded, that they could not keep up steam, etc. Less than $60 got new parts for the valve gear, also paid for some machine work and fitting on the valves and valve seats. After adjusting the valve gear, the engine carried the full load satisfactorily, and there was no trouble to keep up the steam pressure required. This small expense for tuning up the engine saved the company the expense of installing a new and larger engine, an additional boiler, smoke stack, etc., which they had come to think would be necessary.

The engine certainly was overloaded, due to the condition it had been allowed to reach, yet the small outlay for repair parts and machine work brought it back to its original capacity, and to-day it is still driving that same mill to everybody's satisfaction. Taking account of present business conditions, you can be sure that the manager is very glad that he has been able to retain his Wheelock engine, and has the cash on hand instead of invested in a larger power plant.

### Example III.

At a certain lumber mill working all kinds of large timbers, both rough and dressed on the ground floor, with the upper floor rented to a box manufacturer, the machinery was all driven by one engine—a Monarch Corliss, with double eccentric valve gear. The engine was supplied with steam at 90 lbs. per sq. in. pressure from one return tubular boiler. Both the engine and boiler were in one room, and the former was so close to the latter that the fireman could turn around after putting on a fire and lean his shovel against the engine cylinder just as conveniently as to lean it against the wall.

An engineer and fireman were employed to operate this small outfit, and at one time the refuse from the mill more than supplied the necessary fuel. In addition, shavings were baled and sold. A time arrived, however, when there were no shavings to bale. All refuse was used for fuel, and coal had to be bought to make up what the refuse was not sufficient to secure. This plant,

in a word, went down from "no coal to buy and shavings to sell" to "no shavings to sell and coal to buy."

The main cause of the trouble lay in the engine valve gear, which had been altered so that the engine wasted an enormous quantity of steam. In spite of this, the wheels kept turning, and the

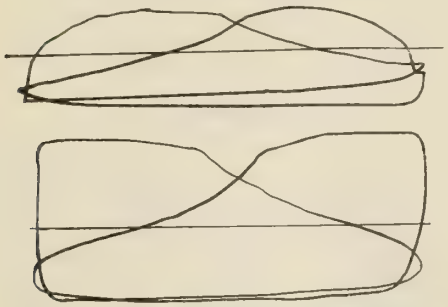

FIG. 3. THE UPPER AND LOWER DIAGRAMS ARE FROM A LOW-PRESSURE CONDENSING ENGINE, 34 IN. X 36 IN., 60 R.P.M., BEFORE AND AFTER ADJUSTMENT RESPECTIVELY.

only difference noted by the owners was that the fuel bill had grown.

About five hours' time was devoted to the correct adjustments of the engine valves and valve gear, with the result that the shaving baler again became necessary, and the coal purchase brought to a finish. In one week's time the fireman was paid off, the engineer did his own firing and received an increase in pay. Neglecting the fuel cost altogether, and assuming the fireman to be paid $12 per week, and that the engineer had $5 per week more, then the net saving in wages alone was $7 per week, or, say, $350 per year. If we add to this the saving of coal plus the income from the sale of shavings, less the cost of baling, etc., we have a very nice sum of money to the credit of the plant as a result of a very small outlay to tune up the engine.

The diagrams in Fig. 4 show the condition of the valves before and after adjustments.

### Example IV.

Figs. 1 and 2 were taken from engines as stated, and show conditions before and after adjustments. Both engines were fitted with single valves of the balanced slide valve type, and the regulation was by shaft governors. Two boilers were steamed in this plant, and the fireman had to keep close to his job to maintain the necessary pressure. After making the adjustments shown, there was a decided improvement apparent in the boiler room, due to the boilers steaming much easier.

### Example V.

Fig. 3 shows diagrams from the low pressure cylinder of a cross-compound condensing Corliss engine. The first diagram shows the valve adjustment as I found it. In this condition, the engine would not carry its full load unless the live steam by-pass to the receiver was open. As the load would drop off, some one had to run and close the by-pass, then open it a little, and so on. One man was kept busy opening and closing the by-pass valve and oiling the engine.

It can readily be understood that such a method of operation was very poor; eating up a great amount of fuel, besides making the regulation of the engine speed as undesirable as possible. After a few alterations to the valve gear of the low pressure cylinder, the second diagram was obtained, and in this condition the operation of the engine was very satisfactory. The by-pass to receiver was never used while the engine was in operation, and only so for "warming up" before starting, or sometimes in starting up to supply steam to low pressure side to pull the high pressure side off the dead centre. The engine governor now has a chance to perform its work and the speed regulation is satisfactory.

Regarding the fuel, as there was no record of fuel before and after, I cannot state definitely the saving made, but can state that there are three boilers of equal size in the boiler house, and two

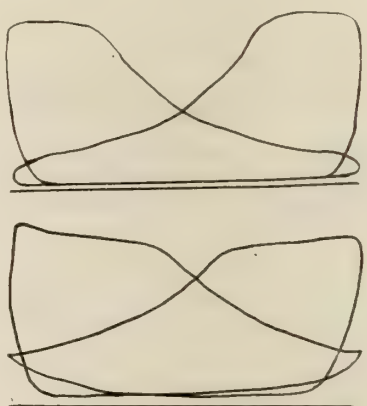

FIG. 4. THE UPPER AND LOWER DIAGRAMS ARE FROM A DOUBLE ECCENTRIC MONARCH CORLISS ENGINE, 20 IN. X 36 IN., 100 R.P.M., AND SCALE 40, BEFORE AND AFTER ADJUSTMENT RESPECTIVELY.

are used at a time. If the condenser gave trouble, the three boilers were fired to keep steam under the old condition. but, after adjustment of low pressure cylinder, only two boilers were ever used, no matter whether the condenser was on or off. It should be abundantly clear that there must have been a saving of fuel, for a 2-in. by-pass line cannot be open, say, for five hours per day blowing steam into a receiver without using up considerable coal. Hence if by correcting the defective adjustments the 2-in. line is not now used, its equivalent in fuel must have been saved.

### Example VI.

Fig. 5 is from a slide valve engine. Diagram No. 1 was obtained with the throttle wide open and governor belt off, engine loaded, and running 160 r.p.m. The diagram shows an improperly designed slide valve.

Two hours' work in a machine shop altered the valve, correcting the defects and, after adjustments were made, the engine would run away with the load that before held it down to 160 r.p.m.

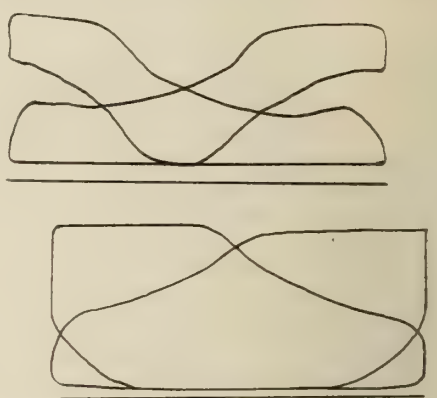

FIG. 5. THE UPPER AND LOWER DIAGRAMS ARE FROM A SLIDE VALVE ENGINE, 8 IN. X 12 IN., 160 R.P.M., AND SCALE 40. BEFORE AND AFTER ADJUSTMENT RESPECTIVELY.

After alterations, the engine carried the load at 160 r.p.m. with the throttle valve open two-thirds of a turn instead of wide open. The second diagram shows the steam distribution after alterations.

## SIGNIFICANT FIGURES.

ARISING out of and embraced within the contents of the preliminary reply made by Sir Edward Grey, Britain's Foreign Secretary, to the United States Note concerning export shipments, it appears that these from New York to Denmark amounted in November, 1913, to $558,000, while those of the corresponding month of 1914 to that country amounted to $7,101,000. Exports to Sdewen rose from $377,000 to $2,858,000; those to Norway from $477,000 to $2,318,000, and in the case of Italy from $2,971,000 to $4,781,000. The American Government were also reminded that copper exports from the United States to Italy from the beginning of the war up to the end of the third week in December amounted to 36,285,000 lbs., as compared with 15,202,000 lbs. for the corresponding period of 1913, and that those to countries which are grouped together in the official returns under the heading "Other Europe"—which includes Norway, Sweden, Denmark and Switzerland—stood at 35,347,000 lbs., as against 7,271,000 lbs. in 1913. This is quite enough. No further argument whatever is needed. If innocent American trade suffers any injury the responsibility lies entirely at the door of those American traders who—as the above figures prove—have been supplying our enemy with the munitions of war.

# PROGRESS IN NEW EQUIPMENT

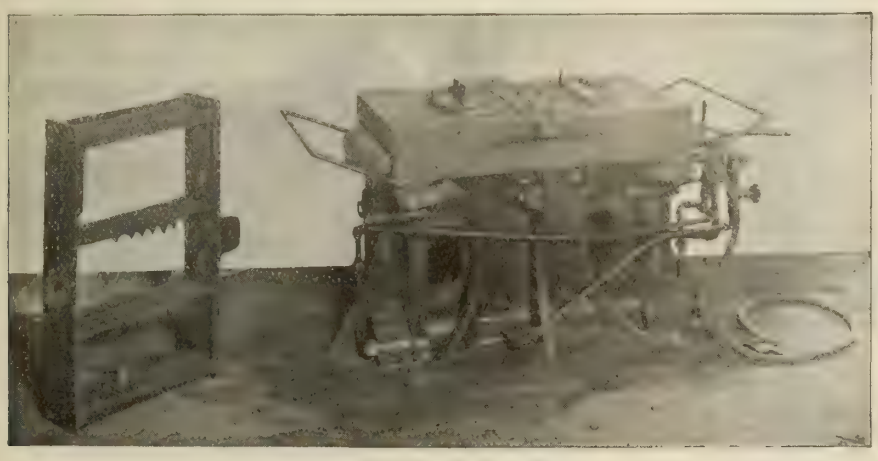
A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## STRIPPING PLATE JOLT MACHINE.

ANNOUNCEMENT is made of a new Osborn molding machine which automatically performs practically all of the operations necessary to mold-making, except shoveling of the sand, and is especially adapted for the making of moulds for journal boxes and work of a general nature. It of course delivers a better quality of mould than hand-work, reduces waste to a minimum, is very much easier at every step, and materially lessens labor cost, as skill is not an important qualification for the operator.

The apparatus is known as the Osborn Stripping Plate Jolt Machine No. 450, and is adapted to use with any of the standard types of stripping plate equipment in any size. As the pattern is drawn through the plate by power, accuracy is a feature on which much stress is laid. One of the most obvious advantages of the machine is the speed at which moulds are made—taking a single mould or, more particularly, continuous operation. The mould is automatically jolted and stripped much more quickly than by hand, and as all operations are positive, speed is further enhanced thereby.

The table size can be varied, which is sometimes desirable where the machine is to be used on one particular pattern, the advantage being that with the table made about ⅛ inch less than the flask sizes, the sand does not pile up on the table; or in other words, does not require the brush or blowing off of the sand before returning stripping plate to position.



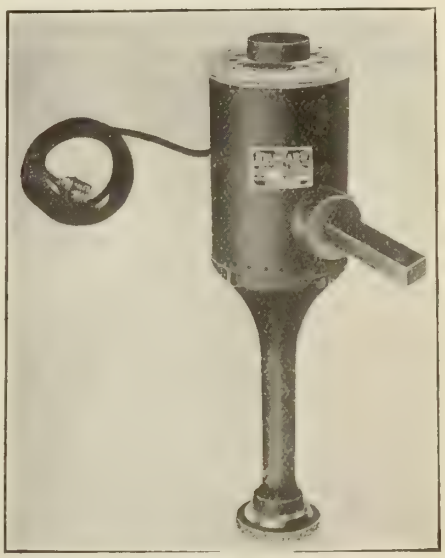
JOLT STRIPPING PLATE MACHINE READY TO RECEIVE FLASK.

Jolt.—The construction of the jolt is similar in all respects to the Osborn No. 100 plain jolt machine, being equipped with the Osborn air cushioned balanced jolt valve.

Drawing Mechanism.—The draw cylinders are cast in one piece and connected to the base of the machine by large fitted bolts. These cylinders extend below the base and are so designed as to set inside of 8 inch pipes inserted in the foundation. The piston rod, which is also the guide rod, is planed on the side and provided with gear teeth which mesh with pinions cut from a solid shaft extending from one cylinder to the other. Both this pinion shaft and the guide rods are entirely enclosed and self-oiling, while the pinion shaft is used to prevent one rod traveling faster than the other.

Air-Operated Flask Clamps.—The machine is provided with clamps operated by air in order to rigidly lock the flask and stripping plate to the table of the machine. This is not always required, but on certain classes of work it is found to work to great advantage. A bale swings over the end of the flask—the bale being made of spring steel, in order to compensate for unevenness in the height of flasks. The machine is fitted complete with all piping, valves, lubricators, etc., ready to set on the foundation; the purchaser only being required to bring his air line to the machine.

In operation.—After the flask has been filled and jolted, the air is turned into the draw cylinders, this rapidly stripping the flask and stripping plate upward from the pattern. After lifting mould away, the valve handle is thrown to the opposite position, which supplies air above the piston, rapidly returning stripping-plate ready for the next mould. This is an important feature of the machine, as it is not necessary to await the exhaust escaping from below the cylinder and then depend upon gravity for the return. In many instances it has been found that gravity is not sufficient to overcome the wedge action caused by sand between the pattern and stripping-plate. Both the stripping and lowering action are equally as fast as that of hand-power on the old-style machine.



NEW INTERNAL GRINDER.

The rated and maximum stripping capacities with 80 pounds air pressure are 800 and 1,000 pounds respectively, while the maximum jolting capacity is 1,200 pounds. The standard table size is 19⅜ inches by 32 inches, the pattern draw 14 inches, and the height of table from floor 24 inches.

## NEW INTERNAL GRINDER.

THIS new grinder has been designed for grinding gasoline engine cylinders, air cylinders, etc., and has, it is claimed, been found very effective for that class of work. It is attached to tool post on lathe where it can be held rigid. The Universal motor is used which operates on both alternating and direct current and low frequency circuits such as 25, 30 and 40 cycles, being particularly adapted to all of these and interchangeable on either. The grinder is fitted with an emery wheel 3½ inches in diameter by 1 inch face and the motor has a speed of 7,000 r.p.m., which makes this tool especially adapted for internal work as the surface speed of emery wheel is approximately 6,000 ft. per minute.

This grinder is ball-bearing equipped throughout, the double roll S. K. F. bear-

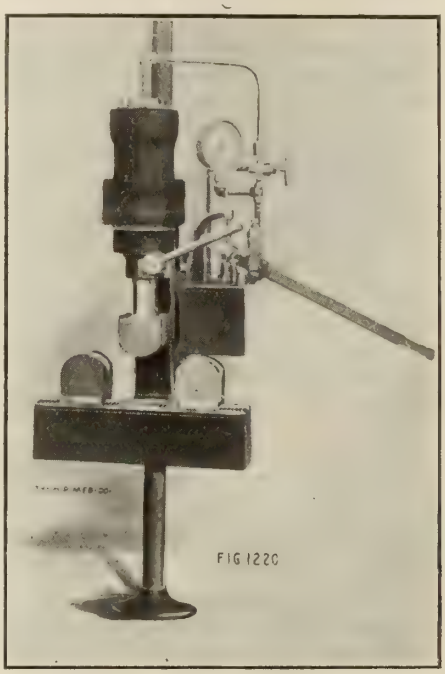
ing being used. Armature shaft is extremely rigid, thereby preventing clatter of the emery wheel. Three ball bearings are used to support the shaft. The capacity of motor is ½ h.p., it being form-wound and impregnated in Bakelite, which insures against forms of motor trouble incident to high-speed electrical apparatus if constructed according to slow-speed motor practice. The weight of tool is 35 lbs., and can be operated off any incandescent lamp socket or it can be attached to power circuit.

The Standard Electric Tool Co. are manufacturing and placing this product on the market.

## 30-TON HYDRAULIC PIPE BENDER.

THE illustration shows a press which was primarily designed for bending pipe of various sizes. The press is however, also adaptable for miscellaneous work required in machine, railroad and automobile shops such as bending and straightening axles, small structural shapes, bars, shafts, etc. By the use of bending blocks, pipe up to 4 inches in diameter can be bent, and clamps are provided for attaching the press to a stanchion which has a maximum diameter of 5 inches.

The material of the press is of steel throughout, the C frame and bending bed being cast in one piece. The top of the C frame is provided with a ring into which the cylinder sets, and when the cylinder is received into this ring and turned to its desired position it is keyed into place. There is an advantage in having the cylinder set in a ring in this manner, because it can be placed in any position desired, bringing the handle of the rack and pinion to the point most convenient to the operator. Another feature about the press which makes it very convenient consists in the bending blocks being changed without the use of wrenches, screws, etc.



30-TON HYDRAULIC PIPE BENDER.

The ram of this press is forced downward by a hand operated pump, with a plunger diameter of ⅝ inches and a stroke of 3½ inches. The pump is equipped with a ½ inch safety valve and ½ inch T wheel operating valve. The reservoir is part of the pump. A hand operated pump is considered desirable on an hydraulic press of this kind because there is no danger of over-bending the pipe.

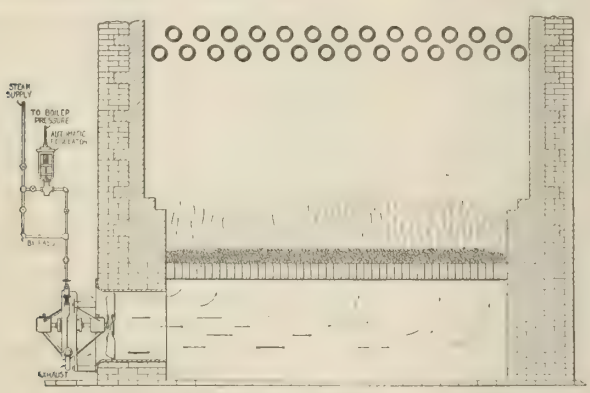
Again by the use of hand power a rapid movement of the ram may be obtained at the start when it is most desirable, and when the bend has almost reached the predetermined point, any desired speed of the ram can be developed. This is particularly advantageous because it produces just the character of bend wanted. The rack and pinion is provided for the rapid movement of the ram to the work before the pump is operated. The downward movement of the ram fills the cylinder with fluid and the upward movement returns the fluid to the water box. In this manner there is no lost motion in the operation of the pump. A maximum pressure of 30-tons is developed on the press.

The ram has a diameter of 6 inches and a run of 9 inches, and the pressing bed which receives the bending blocks is 27 inches long with a pressing width of 8 inches. When the ram is returned the distance from the top of the cylinder to the head of ram is 24½ inches, and the daylight between the ram head and pressure bed is 14¼ inches. The height of the press over all is 3 ft. 11 inches.

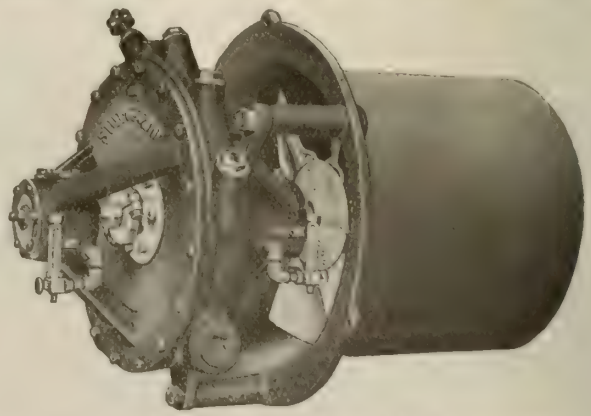
This particular press is a new design recently developed and added to the line of hydraulic machine tools manufactured by the Hydraulic Press Mfg. Co., Mount Gilead, Ohio.

## TURBO UNDERGRATE BLOWER

THE necessity for more furnace draft often arises in the case of existing steam power plant installations and, to meet such contingencies, the B. F. Sturtevant Co., of Galt, Ont., and Boston, Mass., have placed on the market a new design of turbo undergrate blower, compact and self-contained, so that it can be installed in the boiler brickwork with the minimum of expense and least interference with the plant operation. In its general features it is practically identical with the large standard turbines made by the company, the bearings being provided with oil-ring lubrication, while a floating metallic stuffing-box prevents steam getting in them and allows of 15 pounds back pressure being carried. This turbo blower is controlled by from one to six nozzles according to the amount of steam required, the fireman regulating the steam consumption for any particular load by shutting off one or more nozzles.



STURTEVANT TURBO UNDERGRATE BLOWER ARRANGEMENT.



STURTEVANT TURBO UNDERGRATE BLOWER

**James W. Leonard** retired from the position of assistant to the vice-president of the C. P. R. last Monday. Mr. Leonard will take up his office as head of the Toronto Terminal Co. at once. This would indicate the early resumption of active operations in the construction of the new Union Station.

## CANADA'S WAR ORDERS.

IS Canada getting her full share of war orders? This question can be answered quite emphatically in the negative. Although irresponsible statements have been published in the press to the effect that contracts have been placed in this country amounting in the aggregate to $200,000,000 it can be stated authoritatively that the total does not exceed $50,000,000, that being an outside figure, covering everything. Many manufacturers who are in a position to fill orders and who are prepared to do so at the lowest price compatible with a satisfactory product, have not received a dollar's worth of business, while orders have gone to American firms, which they were equipped to handle.

It is highly necessary that business within the Empire be maintained at as close to normal as conditions permit. War orders placed within the Empire mean the retention of the money and a consequent increased circulation. If "silver bullets" can win the war, the placing of war orders at home is an essential step to the victory of the British cause.

The arrangements for the placing of British and allied war orders in Canada are good as far as they go. Orders for shells and ammunition go through a committee and it is understood that all factories which can handle such orders are being worked to capacity. Orders for uniforms are handled separately. All other contracts are handled by Frederick Stobart who has been placed in Montreal as accredited representative of the British War Office with full powers to act. Mr. Stobart, who is a Canadian business man of high standing and recognized probity, does not receive remuneration for his services. That he has done his work well and fairly is a statement that needs no defence. The system is, briefly, as follows:

Samples and specifications for supplies are sent to Mr. Stobart who then gets tenders from Canadian manufacturers. Where quality and price are right, orders are placed. No other considerations enter into the letting of contracts. Political affiliations and personal pull have been eliminated. Do the arrangements thus made go far enough? Does the War Office offer, through Mr. Stobart, as much work as the Canadian manufacturers are in a position to handle? Are not contracts awarded to United States firms without any consideration as to whether they could be carried out in Canada? These are questions that the business men of Canada are asking; that the Dominion Government should ask.

It is a fact that individual manufacturers have gone to London with representations on their own behalf. The Canadian shoe manufacturers have formed an association and sent a delegation to London, but up to the present this has resulted in little business. It is said that the Dominion Government offered its services but that the offer was politely declined.

The situation then is this. The efforts made to secure more business from London have demonstrated that Canada is not getting as large a share as the country is in a position to handle. The lack of success attending these efforts shows that the matter **has not been handled in the right way**; for the Imperial authorities are fully alive to the value of placing contracts within the Empire.

The question to be decided then is: How best can Canada's case be presented? The answer is not hard to find. The Government should lead the manufacturers in a determined, comprehensive campaign with the object of securing for Canada the maximum of war business. Let the Minister of Trade and Commerce fulfil the real functions of his office by organizing a campaign, backed by the full weight of Government authority and prestige, to place Canada's claim before the authorities at London. Let the Dominion Government say to the War Office: "We can handle such and such a share of your requirements, and we will guarantee quality, price and satisfactory delivery. By giving us as much of the business for the British and allied armies as we can handle, before sending orders abroad, you will not only keep the flag of prosperity flying, but aid and abet enthusiasm towards the overthrow of German despotism."

This is the duty of the Department of Trade and Commerce at the present juncture. Is anything being done?

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

**Montreal, Que., Feb. 1, 1915.**—The general situation, in the iron and metal trade after the expiration of one month of the new year, has undergone but little change. As compared with December, the January sales have not shown any appreciable increase. However, there seems to have been an increased number of inquiries, although these have not as yet resulted in the placing of any large volume of business. The foundry business is extremely dull, while the market for machine tools is also more or less quiet. The equipment of most factories has been more than sufficient to take care of the diminished amount of business moving at the present time.

In metals there exists more or less activity on account of the demand for munitions of war both on this continent and in Europe.

#### The Steel Trade.

The railways, which have always figured largely in the consumption of steel rails and other products of rolling mills, have suffered severely by the general curtailment of business, hence they are placing but small orders for steel and equipment. The demand for merchant bars has greatly decreased, yet activity in this feature is as marked as any. The demand for building sections has been very small. However, all indications at present point to a revival in the early spring.

Canadian and American bridge and construction companies have representa-

tives in Europe at present, with the idea of securing business for their respective firms.

### Pig Iron.

Little or no trade in pig iron has been moving since the beginning of the war. British iron has all been kept for domestic consumption at home. The price of pig and ore in Britain, suitable for producing steel, has risen considerably, due to the increased demand by the Admiralty and War Office. The increased freight rates and insurance premiums on ore from Spain, Norway, Sweden and Algeria have also tended to increase the price. American business is dull and the price rather low.

### Machine Tools.

The demand for machine tools is extremely light. However, the situation is rather unique, because there is an ever-increasing number of shops entering into the manufacture of steel shells, and plants endeavoring to equip themselves for this class of work have been purchasing more or less heavily. However, the volume of business passing as compared with that of previous years is small. The supply business continues much the same from week to week. Orders are constantly being received, but they are generally small.

### The Metals.

Owing to the demand for war materials being ever on the increase, the metal situation contains many interesting features. Copper still presents a very strong appearance. Many factors, of course, influence copper prices; the European demand and reduced production being the principal contributories.

Spelter is quite strong, and at the moment no large quantity can be purchased for immediate delivery. The prices for smaller amounts have jumped up ¼ of a cent per pound the last week. Tin also has taken a jump up of ½ a cent a pound. The increasing demand has been, of course, responsible for the upturn. Lead remains very quiet. The antimony increase in price has not yet been reported, but the market is strong and the supply limited. Aluminum, like lead, has not been very active during the week.

---

**Toronto, Ont., Feb. 2, 1915.**—General trade conditions are practically unchanged, although the outlook is perhaps a little brighter. The majority of those factories which are not working on Government orders are quiet. War business, however, is developing, and has already assumed considerable proportions, and will help to offset the loss of business through ordinary channels. The heavy demand for foodstuffs is also tending to keep up the volume of trade.

The yearly balances of manufacturing concerns for last year do not show up favorably as compared with the previous twelve months, but this can hardly be wondered at, considering the conditions which prevailed, especially the last five months of 1914. There is considerable speculation as to what lines will be affected by the new budget, and to what extent the tariff will be increased. The necessity of increasing the revenue of the country is recognized, and higher duties will no doubt be accepted without much criticism.

Conditions in the steel trade continue quiet, reflecting other industrial conditions. The scrap metal market is dull and prices are unchanged. There is continued activity among machine tool dealers on account of the increased demand for tools for making shells. A new price list for waste is out, cotton wastes are cheaper and wool wastes have advanced. The metal markets are firm, tin and spelter having advanced 1c and ½c per pound respectively. The local demand is light, but improving in volume.

### EQUIPMENT FOR VICTORIAN RAILWAYS.

**Tender forms are open to the inspection of Canadian manufacturers at the Department of Trade and Commerce, Ottawa, for the following equipment:—**

**28,295—71 tons steel channel bars (as per drawing).**

**27,517—1 high-speed lathe, with tools and accessories.**

**The last mail available for the tender closing at Melbourne on March 24 is that scheduled to leave Vancouver (envelopes should be endorsed "via Vancouver") on February 17 and due at Melbourne on March 13. The last mail for the tender closing at Melbourne on April 7 is that leaving San Francisco (envelopes should be endorsed "via San Francisco") on March 3 and due at Melbourne on March 31.**

### Steel Market.

There is nothing of particular interest to note in the iron and steel trade this week: business is still quiet, more or less on account of a similar general condition. A fair amount of business has been booked for European account, but it has been stated on good authority that the margin of profit is small, and considerable difficulty is being experienced in obtaining ships to carry the goods. The building trade shows no improvement, but there is a little better demand for merchant bars from manufacturing interests. There have been no price changes and the market is firm.

The steel trade in the United States is gradually improving and prices on bars, plates, and shapes are holding firm. Galvanized sheets have advanced $3 per ton on account of the high price of spelter.

### Pig Iron.

The market is dull and demand light. Most foundries continue to work considerably under capacity, and are buying to fill immediate requirements only. Prices are unchanged.

### Machine Tools.

There is considerable activity in machine tool circles on account of the demand for equipment for making shells. Several nice orders have been booked this week by local machinery dealers, and further developments are expected. Further orders for shells have been placed recently, and in almost every case special tools have to be purchased. This being the case, there will be a continuance of good business in machine tools for some time to come.

### Supplies.

The chief item of interest this week as regards supplies is the change in prices of cotton and wool waste. The new list is given in the selected market quotations, from which it will be noted that all cotton wastes have been reduced on account of cheaper cotton; on the other hand, wool wastes have advanced, the raw material being higher. Linseed oil is unchanged, but higher prices are anticipated on account of the continued advance in flax-seed. The demand for supplies generally is light, although an improvement is noticeable.

### Metals.

There is a little better demand for metals in the local market. Prices are firm all round, tin and spelter having advanced 1c and ½c respectively. The copper market is very firm and exports are heavy, practically all being taken by the allies. Production is being increased at the mines, and is now probably 75 per cent. of normal. Copper advanced slightly in London, but the local market is unchanged at 15c per pound. Tin has advanced in London, which is attributed to manipulation. In the local market tin has advanced 1c, being now quoted 37½c per pound. Spelter continues to advance and present prices are nominal. The price is ½c higher, being quoted at 7½c per pound. Lead is strong at advanced prices in the primary market, due to big business. The local market is unchanged at 5c per pound. Antimony is firm and unchanged at 18c per pound, while aluminum is also unchanged at 22c per pound.

## RUBBER SHIPMENTS TO UNITED STATES

THROUGH the efforts of the Rubber Trade Association of London and the Rubber Club of New York, arrangements were perfected for a second shipment of 1,000 tons of rubber, to go forward last week to the British Consul in New York. The consul will apportion the rubber among manufacturers who sign a guarantee that the resultant product from this shipment will not be exported to Germany or Austria.

The Rubber Trade Association hopes that at least 1,000 tons of rubber will be shipped monthly under the same conditions for the benefit of American manufacturers other than the large concerns which gave heavy bonds enabling them to procure all the rubber desired from London. The association felt that some such action was necessary to prevent a few large American concerns from obtaining entire control of the market. Ordinarily about 3,000 tons of crude rubber is stored in London, but the present amount is estimated at about 8,000 tons, as a result of the embargo on its exportation. Trade experts estimate that America normally requires 40,000 tons annually, of which about two-thirds is supplied from London.

The Rubber Exports Committee named by the Government to provide a plan for regulating exports during the war is attempting to formulate a more permanent method for handling American business in such a way that Germany will not obtain the manufactured goods. In the meantime, the Rubber Association believe that American manufacturers properly vouched for will be able to obtain supplies from the shipments which leave under special Government permits. Experts estimate that 1,000 tons of rubber monthly will be sufficient to keep the American factories operating around normal capacity.

## STEEL CO. OF CANADA CONVENTION.

ON January 13, 14 and 15, the Steel Company of Canada, held its third annual convention of sales managers, works managers and salesmen at Hamilton, Ont., representatives being present from as far east as Halifax to as far west as Winnipeg. The convention was in charge of Robert Hobson, the general manager, assisted by F. H. Whitton, assistant general manager, and R. H. McMaster, manager of the Montreal plant. The president, Chas. S. Wilcox, and the vice-president, Cyrus A. Birge, were present at the various sessions.

The business of the convention was devoted to practical demonstration of sections of the company's plant, while special attention was given to the various papers presented.

The business outlook was also touched on, and the general opinion was favorable to a better year ahead than was anticipated a few months ago.

# Canadian Commercial Intelligence Service

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

### CANADIAN TRADE COMMISSIONERS

**Argentine Republic.**

H. R. Poussette, 278 Balcarce, Buenos Aires. Cable Address, Canadian.

**Australasia.**

D. H. Ross, Stock Exchange Building, Melbourne, Cable address, Cancoma.

**British West Indies.**

**South Africa.**

D. M. McKibbin, Parker, Wood & Co., Buildings, P.O. Box 559, Johannesburg.

E. J. Wilkinson, Durban, 41 St. Andrew's Buildings, Durban, Natal.

### CANADIAN HIGH COMMISSIONER'S OFFICE.

**United Kingdom.**

W. L. Griffith, Secretary, 17 Victoria Street, London, S.W., England.

# INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

## Engineering

**Strathroy, Ont.**—Howard Statham has opened a machine shop on Frank street.

**London, Ont.**—The Dennis Wire & Iron Works Co. will equip a factory which they have recently purchased.

**Montreal, Que.**—Work is progressing on the new pumping station. An overhead travelling crane will be required.

**Campbellford, Ont.**—It is reported that the Dickson Bridge Works will be awarded a contract for shrapnel shells.

**St. John, N.B.**—The Lehigh Valley Coal Co. has acquired a property and dock at the waterfront at a cost of $15,000.

**Sarnia, Ont.**—The Mueller Manufacturing Co. is now working on the brass parts of shrapnel shells for the British Government.

**Leamington, Ont.**—The Pelee township council are in the market for a boiler for the pumping station. Alex Baird is engineer.

**Ingersoll, Ont.**—The Ingersoll Machine Co., recently organized, has taken over the Wilson & Short factory. Mr. Wilson is manager of the new concern which has received an order for shells.

**Humboldt, Sask.**—The installation of the civic waterworks pumping plant has been completed and is ready for operation. The sewage pumping station is completed with the exception of the machinery.

**Welland, Ont.**—Thos. B. Allen, of Toronto, appeared before the Council on January 25, presenting a proposition for the location of a factory to manufacture emery. Mr. Allen wished to know what inducement the town would offer the company to locate.

**Montreal, Que.**—It is reported that the Canadian Steel Foundries, Ltd., have secured the contract to manufacture the castings for twenty submarines to be built by the Canadian Vickers, Ltd., for the British Government.

**New Glasgow, N.S.**—It is reported here that the Canada Tool & Specialty Co. have made arrangements to make rifle sights for the Ross Rifle Co. of Quebec. R. H. Mackay is interested in the former company.

**Lindsay, Ont.**—Richard Sylvester has made a request to the council for a loan of $10,000 for the purpose of enlarging his plant. The Sylvester Mfg. Co. makes gasoline engines and pumps, and propose to make traction engines in addition.

**Chesley, Ont.**—The Canadian Bed Co. has received a $100,000 order from the Government to make 25,000 shrapnel shells. The company is installing $12,000 worth of new machinery, so as to be able to start on the order by March 1. G. M. Griffin is the manager.

**Lucknow, Ont.**—The Bag Holder and Machine Co. has been incorporated as the Sepoy Manufacturing Co., with capital of $20,000. The charter members of the new company are: John Joynt, Dr. G. A. Newton, Frank Tate, W. G. Andrew, George H. Smith, Joseph E. Agnew and W. J. Wraith. The charter authorizes the manufacture of bag holders, trucks, wheelbarrows, etc.

**Chatham, Ont.**—A new proposition has been received from the Augustine Automatic Rotary Engine Co. of Buffalo, N.Y., who have been negotiating for the purchase of the Defiance Iron Works plant. The new proposition is one that meets the approval of the Board of Trade and the city council, and it is quite likely that the deal will be closed in the course of a few days.

**Quebec, Que.**—The Ross rifle factory has contracted to furnish the Russian Government with 3,000,000 rifles during the next two years. It will also supply England and Canada with 500 rifles per day simultaneously. The plant, which has already been doubled since the outbreak of war, will be doubled again this year, when it is expected that some five thousand men will be given employment.

**Sarnia, Ont.**—The Sarnia Electric Co. is now installing a 1,250 horsepower steam turbine generator and attachments. This outfit was made by the Canadian Westinghouse Co. of Hamilton. When the new machinery is completed the company will have a capacity of 2,500 horse-power, which is quite sufficient to meet the needs of Sarnia and Point Edward for some years to come.

**Arnprior, Ont.**—A. G. Munich, manager of the lead mine of the James Robertson Co., on Chats Island, Fitzroy, was in Arnprior on Jan. 27, when he met the local Board of Trade and placed before them a proposition for the establishment of the company's proposed smelter and concentrating mill. The proposition in brief is—the company will erect a tram line from the mine to Arnprior, build the smelter and concentrator, and employ from 200 to 500 men, the town to issue 40-year bonds for about $100,000.

## Electrical

**Hamilton, Ont.**—Chairman Ellis, of the Hydro-Electric Commission, announced on January 30 that a cut in rates would be made in a short time, but he was unable to state the amount.

**Bolton, Ont.**—The advent of Hydro-electric into this village was celebrated at the town hall on Jan. 26. Reeve F. H. Leavens presided over a large and enthusiastic meeting. J. J. Porter, Warden of Peel County, pressed the button.

**Kirkton, Ont.**—St. Mary's, Exeter, Granton, and intervening municipalities were well represented at a most enthusiastic hydro radial meeting held in the town hall on Jan. 27. Resolutions were unanimously passed approving the plans of the Hydro-Electric Commission and pledging support in the carrying out of those plans in this district.

**Ilderton, Ont.**—The village on Jan. 25 carried by a large majority a by-law authorizing the trustees to enter into a contract for current with the Hydro-Electric Commission of Ontario. The vote was 29 for the by-law, seven against. The transmission line to serve Ilderton runs from London to Lucan and is already well on to completion.

**St. Catharines Hydro-Electric.**—The annual report of business of a portion of the first year's operations of St. Catharines Hydro-Electric Commission shows a gross surplus of $1,915.98, and allowing for a depreciation charge of $850, makes net surplus of $1,065.98. Although the system is not yet completed, and only one section of the city streets has been lighted by Hydro for three months, the work of construction is still going on. There are now 945 citizen customers, and the Commission announces that business justifies a reduction of ten per cent. in the rates, but this reduction will not go into effect until two law suits are settled.

# Municipal

**North Bay, Ont.**—A by-law will be voted on by the ratepayers some time this month to raise $60,000 for road improvements during the year.

**Toronto, Ont.**—It has been definitely decided to build an incinerator on the site east of the river Don near Gerrard street.

**Renfrew, Ont.**—The town is raising $16,000 for the purpose of installing an electric lighting system. A by-law has been passed.

**Belleville, Ont**—City engineer Evans has presented a report to the council in reference to the proposed filtration basin on Zwick's island. The cost is estimated at $14,485 and includes among other items, 830 feet of 24-in. cast iron pipe and a 24-in. gate valve.

**Kingston, Ont.**—The City Council has been notified by Nicholson & Elliott that they intend throwing up their garbage collection contract. The council will likely arrange for temporary collection while it considers the question of establishing a municipal incinerator.

**Saskatoon, Sask.**—The City Commissioners invite applications for the position of superintendent of the City's Municipal Street Railway. Applications containing particulars of previous experience, etc., will be received by Feb. 25, 1915.—F. E. Harrison, Mayor.

**Thamesville, Ont.** — A mass meeting was held here last Thursday evening to consider the installation of hydro. Reeve G. A. Fraser presiding. It was unanimously decided that the proposition was favorable, and would be submitted to the people at a later date.

**Vernon, B.C.**—The only large work contemplated this year is the erection of a new sewerage disposal plant and under-drainage system, which will be done under the local improvement plan and will cost from $90,000 to $105,000. This work is necessary because of a mandate of the provincial health authorities, who claim that the present disposal works contaminate Kalamalka Creek and Okanagan Lake.

**Peterborough, Ont.**—Arbitration proceedings began here on Jan. 26 to determine the price to be paid by the city under the Hydro system for the distribution plant of the Peterborough Light & Power Co., the city in the meantime having paid into court $100,000, the price placed on the plant by the Hydro-electric Commission. The company claims a much larger amount.

**Medicine Hat, Alta.**—By an almost unanimous vote the ratepayers have passed deficiency by-laws aggregating $155,000, and by almost as large a vote, voted small sums of money for improving the industrial sites, market and parks, paying for spur track laid to industrial site, and granting aid to the Agricultural Society. The extension of time for the C. N. R. to build into the city, and provision for its right-of-way were also passed.

**Toronto, Ont.**—The Toronto-Hamilton highway will not be the only work of its kind in the province when the Government good roads programme is carried into effect. Provincial Highway Engineer McLean returned last Saturday from Ottawa, where he has been canvassing the possibilities of an early start on the Ottawa-Prescott highway, extending some sixty miles from the capital to the boundary.

**ALLIES PURCHASING AGENTS.**

**The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:—**

**British—Col. A. G. Barton and Mr. F. W. Stobart, Ritz Carlton Hotel, Montreal.**

**French—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendance Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.**

**Russian — Messrs. S. Ruperti and Aiekieff, care Military Attache, Russian Embassy, Washington, D.C.**

**Newmarket, Ont.**—It has been decided to submit two measures to the electorate for ratification on February 22. One by-law authorizes the town to enter into a five-year contract with the Toronto and York Radial Railway Co. for a supply of 500 horse-power or more of energy The other by-law gives the council power to float an issue of debentures amounting to $15,000, for the purpose of purchasing and installing the transformers and other equipment necessary for the extension of the system.

# Trade Gossip

**Cobalt, Ont.**—About 300 men have been laid off this week in the camp owing to the power shortage at the plants of the Northern Ontario Light & Power Co. The Coniagas mine and mill have practically been closed down and 125 men are idle at this plant alone. The Dominion Reduction mill has been shut down and the Caribou, Cobalt and Drummond Fraction are idle. The Crown Reserve has also laid off some men. About the same number of men will be out of work until about the middle of April, the mills shutting down in rotation.

**Lessons on Oxy-Acetylene Welding and Cutting.**—A second elementary winter course was started on Jan. 20 at the Montreal Technical School, 70 Sherbrooke street West, on the subject of Oxy-Acetylene Welding and Cutting Processes. Ten lessons will be given, one lesson every Wednesday evening from 7.30 to 9.30. An advanced course is also to be held every Friday, from 7.30 to 9.30, ten lessons in all. This began on Friday, Jan. 22, 1915. Theoretical lessons are being given by experts in both English and French, while the practical side will be taught in a fully equipped shop with individual benches.

**Brantford Hydro-Electric**—The first report of the Brantford Hydro-Electric Commission, as presented to the city council, shows a very satisfactory state of affairs, despite depressing conditions. A large sum was set aside for depreciation and then a net surplus of $2,000 was recorded. The earnings amounted to $35,496.54, and the total expenses $27,322.44, after including such items as interest on sinking fund, interest on debentures of $115,000. The gross surplus was $8,174.10, of which $6,000 was set aside for plant depreciation. This represents nine months' business, as the plant has only been installed completely for that length of time.

**Toronto Harbor 1915 Expenditures—**

The Toronto Harbor Commissioners announced a few days ago that $2,100,000 was the amount estimated that will be be spent by them, and the Government on the harbor during the present year. The chief work contemplated will be the completion of another 5,000 feet of the sea wall to the east. The sea wall of 3,600 feet to the west has been finished except for the capping with concrete, which will be done early in the spring An additional wall to the east is planned and this will be brought to a similar stage of completion waiting for the the concrete capping in the spring of 1916. The approximate amount of dredging during the coming year will be 3,300,000 cubic yards.

**Herman Boker & Co. Reorganize.**—The firm of Herman Boker & Co. is now being conducted under the name of H. Boker & Co., Inc. The same line of

goods will be handled as heretofore, these consisting chiefly of Novo Superior high-speed steel, as well as other steels, and the various lines manufactured by Sir Joseph Jonas, Colver & Co., Sheffield, England. The new company is capitalized at $500,000, Carl F. Boker of New York being president, and Sir Joseph Jonas, of Sheffield, England, vice-president. F. E. Rejall continues as Canadian manager. Neither the old nor the new firm are German, nor are there German capital invested or Germans connected. Small tools such as reamers, milling cutters, taps, dies, etc., are made in Canada, while twist drills are made in both Canada and England.

# Tenders

**Ottawa, Ont.**—Tenders were received up to February 3 for the supply of iron castings and posts.

**Ottawa, Ont.**—Tenders will be called shortly for lead pipe, cast iron pipe, and pig lead. Particulars may be obtained from the Purchasing Department, City Hall.

**Toronto, Ont.**—The Webb Lumber Co., 224 Van Horne Street, will sell their plant and machinery. Tenders to be in by February 8, and full particulars may be obtained from Rutherford Williamson, 86 Adelaide Street East.

**Ottawa, Ont.**—Tenders will be received until Monday, March 1, 1915, for the supply of best quality steam coal, to be delivered in quantities and at places mentioned on forms of tender. Forms of tender can be obtained at the Department of Public Works. R. C. Desrochers, secretary.

**Ottawa, Ont**—Tenders will be received by the secretary of the Board of Control, City Hall, Ottawa, up to Thursday, Feb. 18, 1915, for handrailing and lighting posts for Billings' bridge. Plans, specifications and full particulars may be obtained on opplication to F. C. Askwith, Acting City Engineer.

**Ottawa, Ont.**—Tenders for electric light wiring and fittings for the custom house, St. John, N.B., will be received until Tuesday, February 9, 1915. Plans, specification and form of contract can be obtained on application to the Department of Public Works, Ottawa, and at the office of D. H. Waterbury, Supt. Custom House, St. John, N.B.

**Montreal, Que.**—Tenders, addressed to the undersigned, will be received up to February 9, for steel bars, steel rails and angle bars, castings, sand, stone and ballast, Portland cement, steam coal, and run of mine smokeless coal. Copies of the specifications and tender forms may be obtained upon application to F. W. Cowie, chief engineer.

**Toronto, Ont.**—Tenders will be received, addressed to the chairman of the Board of Control, City Hall, up to Tuesday, March 2nd, 1915, for the construction and delivery of 24-in., 30-in. and 36-in. stop valves, and one 36-in. check valve. Specifications and tender forms may be obtained upon application at the office of the Water Main Extension Section, Department of Works, Room No. 9, City Hall.

**Winnipeg, Man.**—Tenders will be received up to Monday, February 15, 1915, for the removal of two through truss spans and for the manufacture, delivery and erection of two through trussed spans and alternatively for one through truss span and one through plate girder span over the Pinawa Channel. Instructions to bidders, plans, specifications and form of tender may be obtained at the office of the City Light and Power Department, 54 King street.

**Saanich, B.C.**—Tenders will be received by the undersigned at the Municipal Hall, Royal Oak, Saanich, B.C., up to March 12, for the supply of materials, including cast iron pipes and special castings, valves and hydrants. Specifications, schedules of quantities and particulars may be obtained from the municipal engineer's office, upon making a deposit of $25, which will be returned on receipt of bona fide tenders. Hector S. Cowper, clerk, Municipal Council.

**Toronto, Ont.**—The undersigned has been instructed to offer for sale the following:—

Parcel I.—The steamers "Meteor," "Temiskaming" and "Jubilee," with their equipment, the hull of the launch "Kiask," five scows, certain wharf properties, freight sheds and shipway at points on Lake Temiskaming and certain miscellaneous equipment, the whole being the property of the Temiskaming Navigation Company, Limited; and

Parcel II.—The steamer "Silverland" and her equipment, being the property of the Haileybury Navigation Company, Limited.

Tenders for the above will be received by the undersigned up to noon of Wednesday, the 10th March, 1915. James Hardy, assignee for benefit of creditors of Temiskaming Navigation Co., 15½ Toronto Street, Toronto, Ont.

**Ottawa, Ont.**—Tenders will be received up to February the 26th, for 1,000 sets of the undermentioned accoutrements, half quantity for delivery to H.M.C. Dock Yard, Halifax, and half to H.M.C. Dock Yard, Esquimalt, B.C.: Belts, waist (leather); bags, ammunition (leather); bandoliers (leather), braces (leather), water bottle slings (leather); holsters, pistol (leather); pouches, cartridge pistol (leather); mess tins and covers, canvas; haversack, canvas; water bottle, enamelware (with felt cover. Patterns may be seen, and tender forms with full information may be obtained on aplication to the undersigned and to the Naval Store Officers, H. M. C. Dockyards, Halifax, N.S., and Esquimalt, B.C. G. J. Desbarats, Deputy Minister of the Naval Service, Department of the Naval Service, Ottawa.

# Personal

**J. A. Baird**, town engineer of Leamington, Ont., has resigned his position. J. J. Newman has taken over his duties.

**William J. Phelan**, late of the steamship firm of J. F. Phelan & Co., of Halifax, N.S., died there on January 15, aged 52.

**J H. Laughton**, of London, Ont., was elected president of the London and Middlesex Publicity Association at the annual meeting on January 22.

**Howard Kelly**, vice-president of the G. T. R., who was in Toronto recently, declared that the viaduct and esplanade work will go on in the spring.

**Capt. James R. Innes**, ex-commodore of the Michigan Central car ferry fleet, died at Walkerville, Ont., on January 25. Captain Innes was born in Chatham, Ont., 73 years ago.

**G. G. Ulster**, late of Fort William, Ont., has been placed in charge of the London, Eng., office, opened by the Canadian Car & Foundry Co., to look after foreign buisness.

**C. E. McArthur**, grinding expert, the Modern Tool Co., Erie, Pa., will spend several weeks in Canada. Mr. McArthur is making his headquarters at the office of the Rudal Belnap Co., Toronto.

**R. G. Harvey**, the city engineer, of Duncan, B.C., has handed in his resignation. Mr. Harvey has been with the city as city engineer, electrician, and waterworks superintendent almost since its incorporation, three years ago.

**Charles B. Lester**, for the past twenty years head of the sales department of the John McDougall Caledonian Ironworks, Ltd., Montreal, died suddenly at his residence in that city on January 25. Mr. Lester, by his genial personality, made many friends in the Canadian business world, and his loss will be keenly felt by those and his associates in the Caledonian Ironworks.

**W. P. Hinton**, assistant passenger traffic manager of the Grand Trunk System, and the G. T. P. Steamship Lines, has been elected to the presidency of

**H. H. Vaughan**, assistant to the vice-president of the C. P. R., Montreal, Que., and Isaac Harter, Jr., superintendent of the Babcock & Wilcox Co., Bayonne, N.J., have been appointed members of the sub-committee to work with the boiler code committee of the American Society of Mechanical Engineers.

**C. J. Coll**, who for the past two years has been general manager of the Cape Breton Coal, Iron and Railway Co., with coal mines at Broughton, has severed his connection and leaves their service on April 15 to become a partner in the firm of Thompson & Adams, insurance brokers, of Halifax. Mr. Coll became general manager of the Acadia Coal Co., Stellarton, in 1900, leaving in 1912, and engaging with the Cape Breton Company in April, 1913.

**Arthur T. Genest**, one of the best known civil engineers in Quebec and Ontario, died on Jan. 27 at his residence in Ottawa. He was born at Fremont County of St. Maurice, Quebec, on July 10, 1859. Some of the works in these earlier days with which he was prominently identified, were the construction of the Laurentian Railway, and the Pontiac Pacific Junction Railway, now the Ottawa and Waltham. He was the first assistant engineer in the enlargement of the Lachine Canal between 1895 and 1897. He was first engineer for the Rapid Plat and Faran's Point Canal, the Balsam-Simcoe Lake division of the Trent Canal, and was engineer in charge of the final estimates for the completion of the Corwall Canal enlargement, 1901-04. Since 1904 the late Mr. Genest has been an engineer at headquarters for the projection of the Georgian Bay Ship Canal.

## Catalogues

**Anodes and Plating Salts** are described in bulletin No. 600, issued by the Munning-Loeb Co., Matawan, N.J. The bulletin deals with anodes for plating processes, with special reference to the nickel anode and its principal features. Cast and rolled anodes made of other materials are also described. Other matter deals with salts and miscellaneous chemicals used in plating solutions. The bulletin is fully illustrated.

**Cochrane Multiport Valves**, a booklet of 72 pages just issued by the Harrison Safety Boiler Works, 3137 N. 17th St., Philadelphia, describes the multiport valves introduced by that concern for back pressure, relief and vacuum service, flow service in connection with mixed flow turbines, and check valve service with bleeder or extraction turbines. The essential idea of the multiport valves is the use of a number of small disks instead of one large disk, in order to secure greater safety, quietness, lightness of moving parts, and tightness. The several disks are each fitted with an independent dashpot held to seat by independent springs, the tension of all the springs being adjusted simultaneously by a pressure plate, the position of which can be changed by means of a hand wheel on the outside of the casing, thus there are no parts directly connected to the disks themselves extending through the casing, hence little possibility of binding, as by over-tightening of glands, or of tying down or overweighting, the movement of the pressure plate being definitely limited. Another advantage claimed is the ability to adjust the back pressure quickly and easily by changing the position of the pressure plate, which may be done from any distance as by means of chain or rods. For vacuum service, the construction is practically the same, except provision is made for water sealing. For flow service with mixed flow turbines, balance pistons are connected to the disks in such a way that the latter will not open except when the pressure in the exhaust steam pipe is greater than atmosphere. It is thus impossible, where one of these valves are used, for vacuum from the turbine to back up into the engine exhaust line through leaks of piston rod or valve stem packings. The multiport check valve is designed for use with extraction or bleeder turbines, to prevent reverse flow and consequent over-speeding of the turbine. In addition to full descriptive and tabular matter, the book contains numerous diagrams and layouts, also data on the effects of air in condensers and upon turbine performance.

## Book Reviews

**Syren and Shipping** of date January 6, gives a remarkably complete synopsis of the happenings of 1914 as well as making a convincing analysis of the net results of the development of the shipbuilding and shipping business in all its phases during the same time. Every article is written by an expert in his branch. The war figures largely throughout the 156 pages of reading matter and 104 pages of solid advertising which make up this number, and its real effect on shipping, freights, insurance, coal and naval arrangements is demonstrated by highly illuminating statistics. It is a valuable number in every sense of the term.

**Naval Recognition Book**, by Fred. T. Jane, 73 pages, 7¼ in. x 5 in., with maps and illustrations. Published by Sampson Low, Marston & Co., London, Eng-

land. The secondary title of this book, "Silhouettes of British Fighting Ships," more clearly explains the style and purpose of publication, for it is by the silhouette or profile of a warship that it's class can be identified at sea. It may not be out of place to state that warships are built and designated in classes; the number in each class varies, of course, as do also the different classes of ships as regards some feature in design and arrangement of guns. This is the second edition, and the author is a recognized authority on naval matters. A book of this description, at such a time as this, is of more than ordinary interest, for although there are many who have not and may not have the opportunity of seeing any of the ships comprising the British Navy, the fortunes of each ship will be followed with interest during the present war. Silhouettes of war vessels in each class are given, together with the names, displacement, speed and armament. The Dreadnought classes take premier place, followed by all other types of war vessels, such as cruisers, torpedo boats, etc., down to depot ships. Several pages are devoted to silhouettes of British liners of 18 knots or over. The ships are classified according to the number of funnels and masts, while the speed and owner's name are given for each. Other matter inincludes several maps of important British naval bases, details of officers' uniforms, and specimens of British flags. The index, while rendering the usual service, incidentally consists of an alphabetical list of all the ships in the navy: an interesting feature in itself. This manual, although a cheap edition, will be of assistance to officers and men of all ranks in the navy or mercantile marine. It will also be of interest to the general public, especially at this time when the name of each ship should be known to everybody. A companion book to this and by the same author deals with the German navy in the same manner. Copies may be obtained for 40 cents, post free, from the publishers of Marine Engineering, 143-153 University Avenue, Toronto.

## PORTABLE ELECTRIC DRILLS

No. 00

Drilling Capacity 0 to 5-16 in.

A Marvel of Lightness, Strength and Durability.

Equipped throughout with Ball and Roller Bearings.

SHIPPED ON TRIAL AT OUR EXPENSE.

**INDEPENDENT PNEUMATIC TOOL COMPANY**

334 ST. JAMES ST., MONTREAL, CANADA

## Light and Heavy Riveting

can be done equally well on our ELASTIC ROTARY BLOW RIVETING MACHINE because the force of the blow is always under the control of the operator, and quickly adjusted to suit the work.

The machine is made in several sizes and styles, and every head is perfectly formed, any shape you wish

Catalogue?

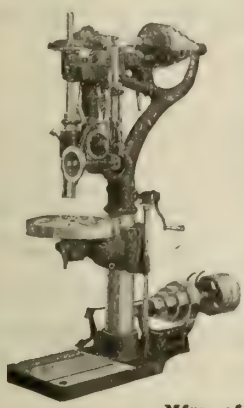
**The F. B. SHUSTER COMPANY**

New Haven, Conn.

Formerly John Adt & Son. Established 1866

Also makers of Wire Straightheners, for rounds, squares, hexagons, etc.

Canadian Agents: A. R. Williams Machinery Co., Toronto.



## Our 23" Mechanic's Drill

has features with which you may not be familiar.

There are eight speeds provided, with quick advance and return.

Stationary Head and Back geared with automatic stop. This drill can be motor-driven and will drive high-speed drills to their utmost capacity. The quality is the same as all "Rockford" quality—the best.

Write for descriptive catalogue.

**Rockford Machine Tool Co.**

Rockford Illinois

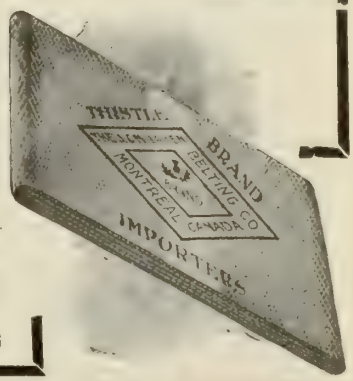
Mfrs. of the Rockford Planer and Shaper.

## "THISTLE" BRAND RUBBER BELTING

"Maintenance of Quality"

is our motto, and our experience in the manufacture of belting since the year 1856 should be invaluable to you. Let us tell you all about this friction faced belting. The price will appeal to you.

Write to-day.



**J. C. McLAREN BELTING CO., LTD.**

**20 TIMES THE SERVICE**

That's what this self-hardening, high-speed steel chaser does for the LANDIS DIE. Four long cutters tangentially disposed to the work carried in suitable holders make an ideal cutting condition. This, along with its many other distinctive characteristics, has established for us a world-wide reputation.

# NO SURRENDER

ought to be the axiom of every balanced mind. Primarily it is fighting phraseology where bludgeon warfare is concerned. But it has a genuine, wholesome adaptation to modern business and a recognized use where *success* is the goal of well-directed effort.

Don't loosen the business grip you have secured and allow others to reap what you have sowed. "What we have we'll hold" is synonymous language for you. Live up to it and hold on to what you've got by advertising in

**As Durable as Paving—**
**and Practically Noiseless**

You can have a floor so tough that it will withstand the wear and tear of your machine shop, and so noiseless that the sound of trucks and other objects drawn across the floor will be almost imperceptible.

# JM Mastic Flooring

is made from Trinidad Lake Asphalt—a material that has stood the heavy street traffic test for paving.

J-M Mastic Flooring is practically noiseless, waterproof and unaffected by acids. Can be quickly and thoroughly cleaned and dries immediately. Possesses a peculiar holding quality that prevents slipping and accidents to employees and is most comfortable to work upon.

J-M Mastic Flooring, applied by our skilled workmen under the direction of specialists, will justify every claim made for it. Our Engineers are ready to furnish advice and suggestions without obligation on your part.

Write nearest Branch for "J-M Mastic Booklet."

*A Valuable New Book on an Important Trade*

# PATTERN-MAKING

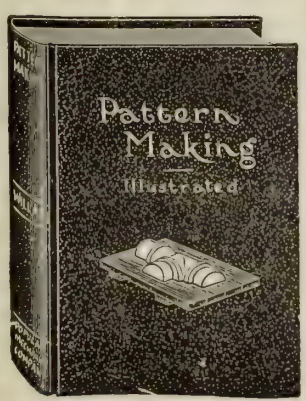
**By G. H. WILLARD**

**Two Significant Opinions:**

"I think the book is the best I ever saw for the price." Edwin Sluyter, Construction Engineer, Burroughs Adding Machine Co., Detroit.

"I consider this is a valuable book and should be in the hands of all men engaged in this line of business." E. W. Clarke, Wilmington Malleable Iron Co., Wilmington, Delaware.

**224 Pages. 312 Illustrations. Cloth Cover.**



**With Additional Chapters on Core-Making and Molding**

**"WRITTEN SO YOU CAN UNDERSTAND IT."**

A book for the man who does the work. Written by a practical patternmaker of many years' experience. Gets right down to business in the first chapter and keeps it up throughout the book. Full of kinks and actual working information. Profusely illustrated.

**Chapter Headings**

I. Pattern-Making as a Trade. II. The Tools. III. Woods. IV. Joints. V. Turning. VI. Turning (Continued). VII. Turning (Continued). VIII. Turning (Concluded). IX. The Circular Saw. X. The Circular Saw (Continued). XI. Machine Tools. XII. Machine Tools (Continued). XIII. Simple Patterns. XIV. Simple Patterns (Continued). XV. Simple Patterns (Concluded). XVI. Crooked Patterns. XVII. Large Pattern Work. XVIII. Large Pattern Work (Continued). XIX. Crosshead Guide Patterns. XX. Sweep Work. XXI. Pipe Work. XXII. Stove Pattern Work. XXIII. Molding—Machine Work XXIV. Molding Pattern Work.

**Part II.—Core-Making and Molding.**

Chapter I. Core-Making, Simple and Complex. II. Principles in Molding. III. Loam Patterns and Loam Molds. Everyone following this trade, or intending to learn it, should have a copy of this valuable book.

**Price $1.10 Postpaid**

WHEN you need new equipment or supplies for your machine shop

**Consult this Directory**

¶ You'll find listed here the reliable makers of the lines you need; firms who believe in the progressiveness of present-day manufacturers and who appeal to their intelligence through their own engineering journal.

¶ Consult Canadian Machinery Buyers' Directory and you can't go wrong in your buying.

# M. A. HANNA & Co.

Sales Agents

Cleveland

Lake Superior Iron Ore, Pig Iron and Coke

Exclusive Sales Agents for

## Victoria Pig Iron

Made at Port Colborne, Ontario

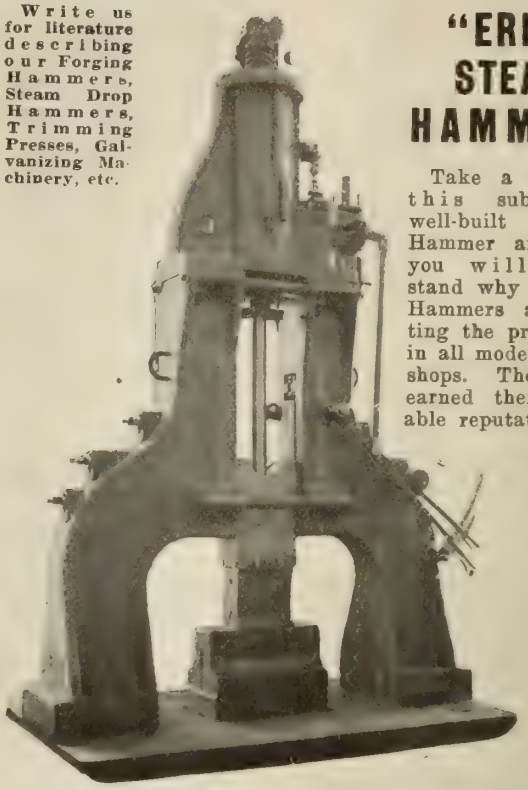
Also

Buffalo and Zug Pig Irons

Made at Buffalo and Detroit

M·A HANNA & Co

Write us for literature describing our Forging Hammers, Steam Drop Hammers, Trimming Presses, Galvanizing Machinery, etc.



## "ERIE" STEAM HAMMERS

Take a look at this substantial, well-built Steam Hammer and then you will understand why "Erie" Hammers are getting the preference in all modern forge shops. They have earned their enviable reputation.

**Erie Foundry Company, Erie, Pa.**

## We Equip Foundries Complete

**Grey Iron, Brass, Car Wheel, Pipe, Steel (OH. & Converter) and Malleable**

from laying out the plant to starting it in operation. Our experts know the foundry and its problems from the ground up. Profit by our thirty years' experience.

Cranes of all Kinds

WHITING FOUNDRY EQUIPMENT CO. HARVEY-ILL. U.S.A. CHICAGO SUBURB

Catalogs on Request

# PERFORATED METALS

XL

Write to us regarding your Tool Room partition problems. We can save you space and light.

We make any size perforation in any kind of metal required.

**Canada Wire & Iron Goods Co., Hamilton**

We also manufacture

- Wire Cloth for all purposes
- Concrete Reinforcement
- Molders' Riddles and Bellows
- Metal Clothes Lockers
- Steel Factory Stools
- Window Guards
- Ornamental Wire and Iron Work

# CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS--Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.
TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.
TO NON-ADVERTISERS—A nominal rate of $5.00 per line a year is charged to non-advertisers.

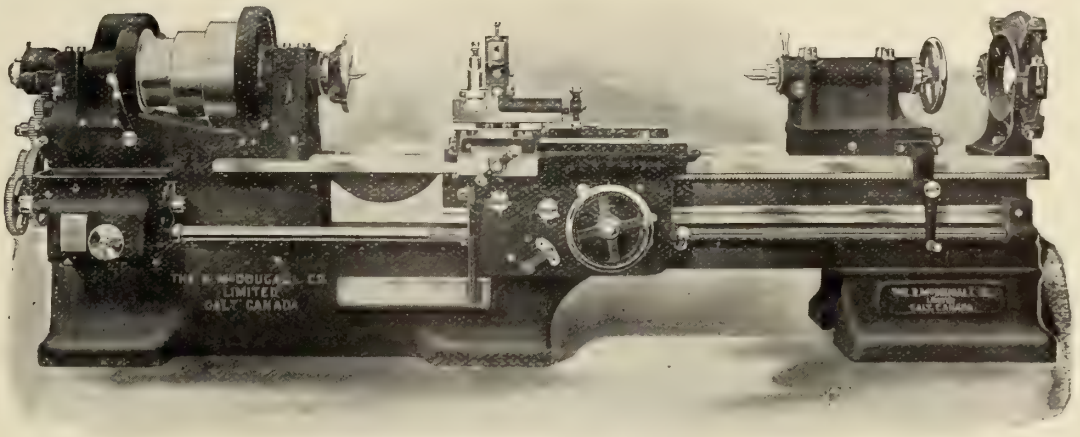
## McDougall Gap Lathes

—

**Strength**
**Accuracy**
**Quality**



Take a look at the next money you intend to invest in a Lathe.
Then, take a look at the money's worth we offer you in our machine.
Your money will soon come back to you in increased production and we will have the pleasure of having a satisfied user. Our machines are just as good as they look and they look good too.
We invite the closest inspection.

ARE-MAC-DEE IS A GUARANTEE

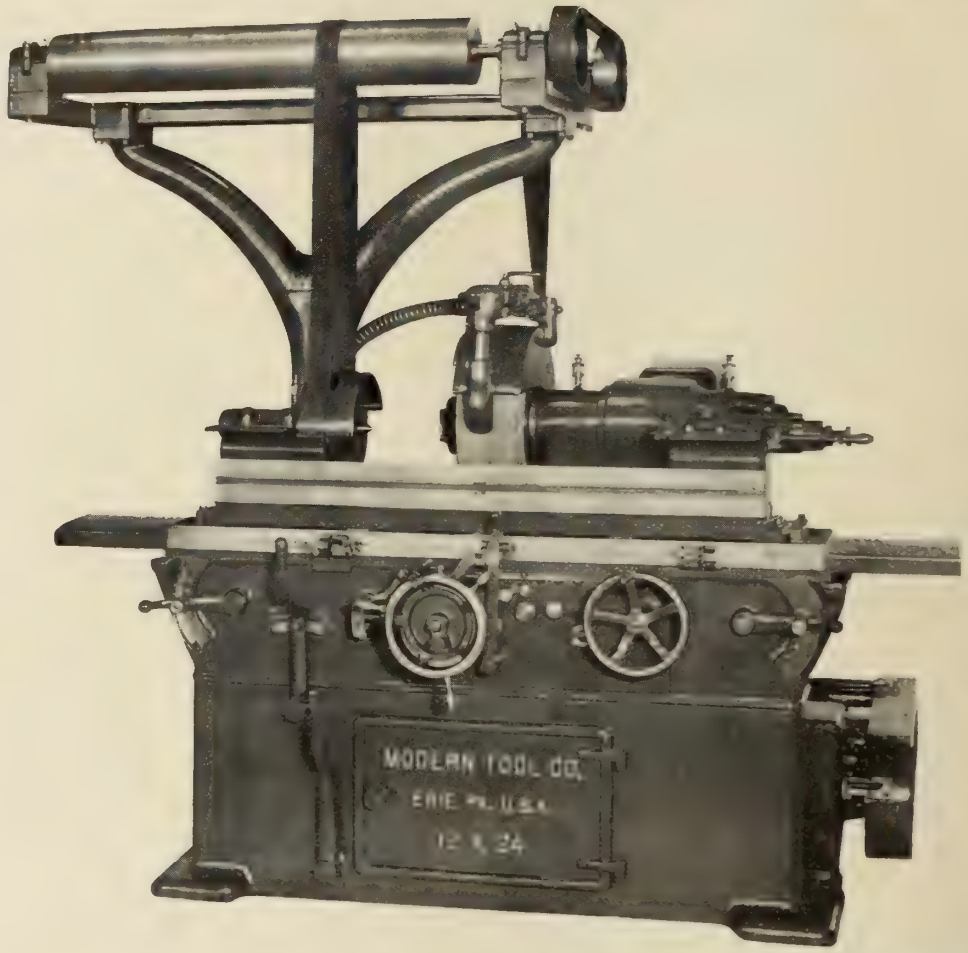
# Finishing Shrapnel Shells

ON THE

## "MODERN" 12" x 24" Self-Contained Grinding Machine



## The heaviest, most powerful and efficient Standard Grinding Machine made for Shell work

The "MODERN" 12" x 24" Grinding Machine is especially adapted for grinding Shrapnel Shells. The Machine is more than guaranteed, it is demonstrated. Large diameter, wide face wheel, with powerful drive automatic feed without traversing the table absolute central control of all levers and hand wheels—single constant speed drive.

We have recently sold a large number of these Machines in Canada, completely equipped for Shrapnel Work. Ask the man who is using the "MODERN."

The large manufacturer appreciates the production possible on this Machine. Machine comes equipped for all classes of straight and taper cylindrical work.

**Send for blue prints and estimates.**

# CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields. Published by the MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg and London, Eng.

Vol. XIII | Publication Office: Toronto, February 11, 1915 | No. 6

## The Three Factors of Accuracy
### The Man ~ The Machine ~ *and the Tool*

BY INVITATION MEMBER OF

NEW YORK U.S.A.

The accuracy of the work laid out and measured by the man and performed on the machine depends on the accuracy of the tools and instruments used. That is why so many good machinists and toolmakers use

## Starrett Tools
### *The Standard Instruments of Precision*

They know that measurements made with Starrett Tools are reliable and they know that they can work faster with them for nearly every Starrett Tool has some feature that saves time. Starrett Tools may be used together to good advantage—for instance, the surface gage may be set by the combination square as shown below.

Send for our big, new, free catalog No. 203, describing full line and giving prices.

**Starrett Tools and Hack Saws are sold at all good hardware stores.**

# Why P. & W. Taps Win

## It's in the Design

One-third of the land from the cutting edge is concentric.

*The remaining two-thirds has eccentric relief.*

The taper-tap has a cylindrical pilot.

The taper- and plug-taps have an eccentrically relieved chamfer relieved clear from the cutting edge.

The highest grade of steel obtainable is used.

## What It Means to You

Taps can be sharpened at the only correct point—on the face of the cutting edge.

Sharpening in no way affects their size.

Can be sharpened long after other so-called eccentrically relieved taps are rendered useless.

We obtain the freest cutting tap with the longest life—an exclusive combination.

Accuracy nowhere else obtainable is secured together with a degree of finish and refinement heretofore thought impossible in a commercial tool.

For a number of years we have made taps with this style of relief. They have won out steadily and consistently on merit alone.

# Starrett Tools

## are used by the men who strive for greater efficiency

The use of a Starrett Surface Gage and Combination Square by the man at the planer below is a good example of efficiency in measuring.

Accuracy is insured because they are Starrett tools, while speed and wide range of usefulness are obtained because all Starrett Tools are designed to give just that service.

The Surface Gage may be set at the proper height by sliding the blade of the square to the desired position and bringing the scriber into contact with the top of the blade.

You men with up-to-date ideas on shop management, know how much can be saved by watching the little motions and operations. You realize that a few seconds saved by each man on a single operation makes a large total.

Let Starrett Tools help save those seconds.

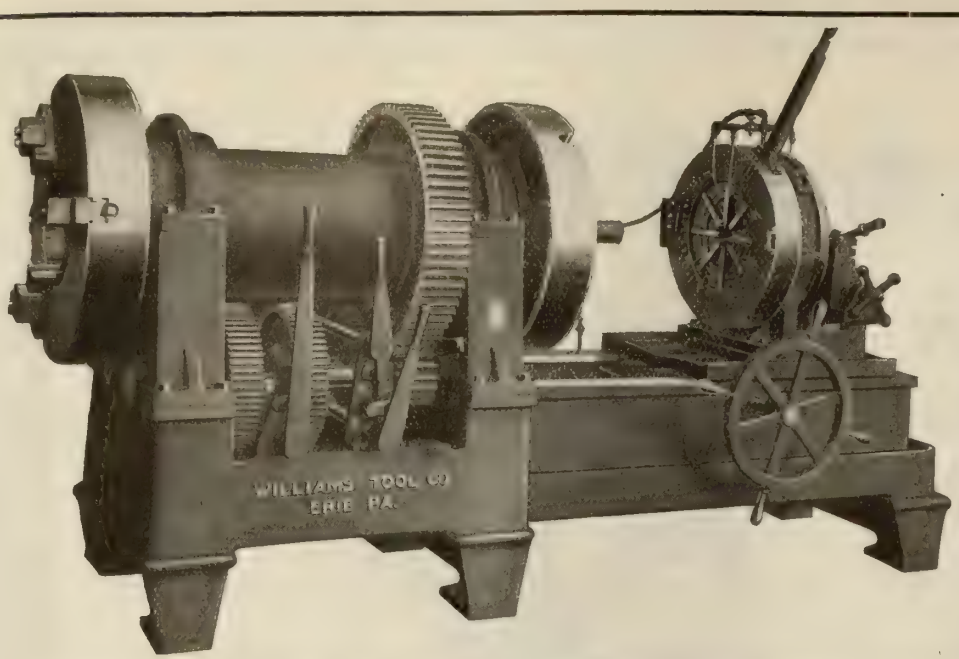
## Starrett Tools World's Standard



The gas light was a big improvement over the tallow dip, but it had to give way to the electric light; and the Tungsten has superseded the little glimmer that once delighted us.

If you are still employing pipe-cutting methods as antiquated as the tallow dip, you need a Williams Pipe Machine, which occupies the same position in the pipe-cutting field as the Tungsten does in the lighting world, to bring you up-to-date.

*Let us quote you prices and terms: any machine to cut 10 sizes of pipe between 1-4 inch and 18 inch, with any kind of power.*

**Anyone making, selling or buying a pipe machine, claimed to be a Canadian-made Williams Pipe Machine, does so without right or authority from us, and is liable to prosecution for damages.**

# PUT YOUR FILING ON A SCIENTIFIC BASIS

**The cost of Files is relatively small. The cost of Filing-Time is large. Hand-labor is always expensive.**

By a slight increase in the cost of Files, you can effect a substantial decrease in the cost of Filing-Time.

When a file requires more time and effort to perform a given piece of work, it has reached the "inefficient" point. From that time on, its further use means impairment of QUANTITY or QUALITY of work—or even both. The total loss through its use will be many times the slight extra cost of SEVERAL new files.

Insist that your men PROMPTLY replace all worn files, when they have reached the "inefficient" point. This point varies with the workman and the character of the work. It can be easily ascertained in your shop.

**In the interest of efficiency, promptly replace all worn files. For economy's sake, replace them with the "Famous Five."**

50 years' experience makes them EFFICIENT. . . . A $60,000,000 output yearly makes them ECONOMICAL. . . . Our specially designed and developed machinery makes them ACCURATE. Our complete control of every manufacturing operation makes them UNIFORM. Over 4,000 different patterns make them AVAILABLE for every class of work. Rigid inspections and **real** service-tests make every file a PERFECT tool.

**We suggest a trial of the Famous Five in YOUR shops. We rest our case on their SERVICE.**

# New Machine Shop, Canadian Locomotive Works, Kingston

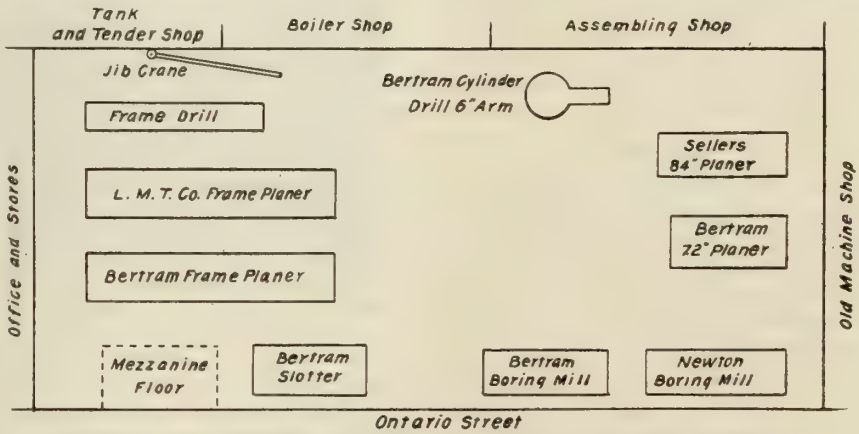
Staff Article

*In our December 25, 1913 issue, we published a general article covering the rebuilding of the entire plant of this old-established concern and pointed out then that the work was being undertaken and carried through in departmental sections with a view to non-interference with the productive side of the plant as a whole. The present article deals with the recently completed new machine shop section, its tool and other equipment.*

THROUGHOUT the past year, further enlargements to the plant of the Canadian Locomotive Works, Kingston Ont., have been completed, the most important of which is the new machine shop. This shop has been erected in accordance with the plans drawn up some time ago for the general extension and the re-building of the whole institution, and in this work the Company have been dealing with a difficult problem, the present site being somewhat cramped in area for the accommodation of a plant of the necessary size and capacity.

The site was first occupied by this firm in 1850. The location is ideal because of the fact that it is on the waterfront, thus ensuring raw materials being delivered by water at the company's piers which are only a few yards away from the works. Electric travelling cranes from the works are carried on their runways right out on these piers, making the handling of materials transported by water simplicity itself.

With regard to rail connections, the firm is also well situated. The Canadian Pacific, Grand Trunk and Canadian Northern railroads all enter the city of Kingston and a spur line from the works connects with each road. Further, the city has grown all around the present location and the works are now within a few minutes walk of the centre of the business district and only a short distance from the residential portion of the city. Kingston also provides a goodly number of homes for the employees of such an institution.



NEW MACHINE SHOP LAYOUT, KINGSTON LOCOMOTIVE WORKS.

Thus the numerous advantages offered by the old site more than compensate for the disadvantage of the cramped conditions, especially so because the new plant has been so completely designed that this disadvantage has been largely overcome. Great credit must be given to those responsible for the general layout of the buildings, forming, as they do, the most compact locomotive shops on this continent. The recent extensions, as they exist at present, are complete in themselves, but the complete plans have not yet been executed. The prevailing industrial depression has caused such a slackening in trade conditions that it has been found that the shop, as it now stands, is quite capable of handling all work meanwhile available.

FIG. 1. EXTERIOR VIEW OF MACHINE SHOP ADDITION.

### Machine Shop Location and Surroundings.

As already stated, the new machine shop is one of the latest additions to the plant. It is, roughly speaking, 190 feet long by 76 feet wide. The framework of the building is steel with brick walls, all being built on a concrete foundation. The southern side of the shop consists merely of a row of steel columns, between which there is free access into the erecting shop, the boiler shop and the tank and tender shop. The wall of the new shop extends above those of the old shops and consists almost entirely of glass. The western end of the shop is bounded by the wall of the old machine shop. There are several large arches cut through this wall giving free communication to the old shop, where there are still being executed many machine operations on the smaller parts. Many of the larger and heavier machine tools have, however, been removed and placed in the new shop, while the remaining tools in the old shop have been rearranged with the idea of increasing the production on the smaller parts.

The north wall is of brick and faces on Ontario street. This is the long dimension of the shop. Large windows and ventilators are found in this wall which add greatly to the good lighting facilities of the plant. The east wall is provided for by the west end of the office, which building adjoins the shop, but this is only a temporary arrangement because the plans for extension provide for a new office building to the east of the present offices. In fact, the foundations for this new office building have been laid. The new shop will then be extended to cover the ground at present occupied by the offices. In the new shop all the tools for the heavy machine work on the locomotive frames, cylinders and drive-wheels are installed. The floor is of mastic asphalt, except in that portion of the floor opposite the erecting room, where a considerable area of creosoted wooden blocks are laid.

### Lighting Facilities.

A wide skylight extends for practically the whole length of the new building, while the roof and monitor are largely of glass, providing an excellent system of natural lighting. The artificial lighting is also very efficient. Two varieties of lights are used, these being the Cooper-Hewitt mercury vapor lamp and the nitrogen incandescent lamp. Both types are fitted with suitable reflectors and when in operation make the shop practically as light as day. The lamps are all suspended from the roof trusses above the crane runways.

All the steel work in the shop, as well as the window frames and cranes are painted a light yellow. The machine tools are all painted grey, and the end walls of stone are all white-washed. Having the interior walls and the contents of the building al painted a light color assists very materially in the distribution of the light.

### Crane Service.

A 10-ton Whiting crane travels over the entire shop. This crane is electrically operated with runway high up in the eaves. In the erecting shop a 20-ton crane is located. The runway is at right angles to the runway of the 10-ton crane in the new shop, and this runway of the 20-ton crane is continued into the new shop for a sufficient distance to allow the latter to run directly under the 10-ton crane in the new shop. Thus, material can be transferred from one crane to another and be transported from one shop to another with the greatest of ease. This feature has greatly increased the general efficiency, especially as the large pieces are all machined in this shop and direct transportation to the erecting shop is assured. Near a large multiple spindle drill press in the south-east corner of the shop, is a 6-ton steel jib crane manufactured by the Northern Engineering Works, Detroit, Mich. From the foregoing it will be noted that the facilities for handling the heavy pieces are excellent.

### Machine Tool Equipment.

In the south-west corner of the shop is placed an 84-inch planer used for finishing cylinders. The machine was furnished by Wm. Sellers & Co. of Philadelphia, Pa. Pieces up to 84 inches square can be machined in this planer which is motor driven by a 35 h.p. variable speed Westinghouse motor. The mechanical application of the power to the table is through the medium of a worm and rack, while the reversing operation is accomplished through an air-clutch. The planer is in every sense a strictly high-class machine. The drive is of particular interest and is giving entire satisfaction. The lowering and hoisting of the cross-head is accomplished through a belt-driven mechanism from the motor.

Beside this planer is another planer, also used in machining cylinders, which was supplied by the John Bertram & Sons Co., of Dundas, Ontario. This planer can handle pieces up to 72 in. square, and is also electrically driven. The motor, manufactured by the Triumph Electric Co. of Cincinnati, Ohio, is of 30 h.p. and of variable speed type. The reversing operation is accomplished through the reversing of the motor. The switchboard, rheostats, starting apparatus and reversing switches were all furnished by the Rudel-Belnap Machinery Co. of Montreal. A small 2 h.p. motor is placed on the standard frame to supply the power used to hoist and lower the cross-head.

In the north-west corner of the shop is placed a Newton boring mill. This machine is driven by a 13 h.p. Westinghouse motor of the variable speed type, and the table is raised and lowered on large screws which are mounted on ball thrust bearings. A 3 h.p. variable speed motor is used to operate these screws. All the motor control switches are enclosed, and guards protect the commutators and armatures of the motors; thus all oil and dirt is prevented from reaching these portions of the machines.

Directly east of this machine is a Bertram boring mill, which is driven by a 10 h.p. variable speed Westinghouse motor. A very ingenious control, furnished by the Electric Control & Mfg. Co., of Cleveland, Ohio, is installed on this machine, on which all the heavy boring of cylinders, bushes, etc., is done, together with the Newton boring mill next to it. The machines are of very massive in construction and do extremely accurate work. Still further to the east is a machine for slotting locomotive frames. This latter machine was also supplied by the John Bertram & Sons Co., Dundas, Ont.. It is driven by a 20 h.p. variable speed Westinghouse motor. The controlling apparatus was also supplied by the Westinghouse Company.

In the eastern end of the new shops are two frame planers of special interest. They are both fitted with an electric system supplied by the Lancashire Dynamo & Motor Co. of Toronto, and their drive is perhaps more efficient and has a larger range of adjustments than any other planer drive manufac-

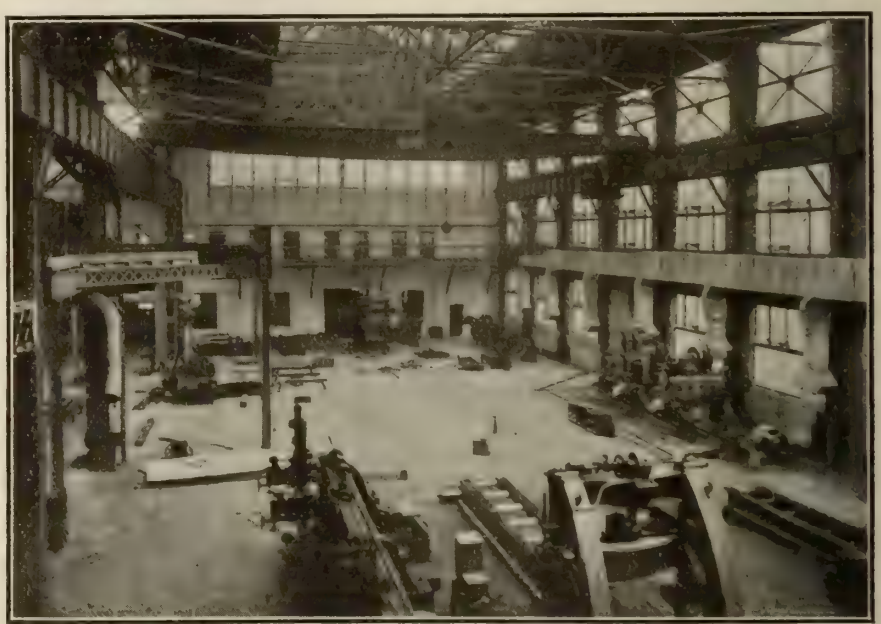


FIG. 2. INTERIOR VIEW OF MACHINE SHOP ADDITION, LOOKING FROM SOUTH-EAST CORNER

Frame Planers and Frame Drill Press in Foreground. Note also Crane Runway from Erecting Shop entering New Machine Shop at Left of Photo. Heating Ducts are shown along North Wall.

tured. The first of these two planers was built by the John Bertram & Sons Co., Dundas, Ont., and was designed especially for the planing of locomotive frames. Between the standards, pieces up to 72 in. in width can be handled, while, under the cross-head, about 18 in. to 20 in. is

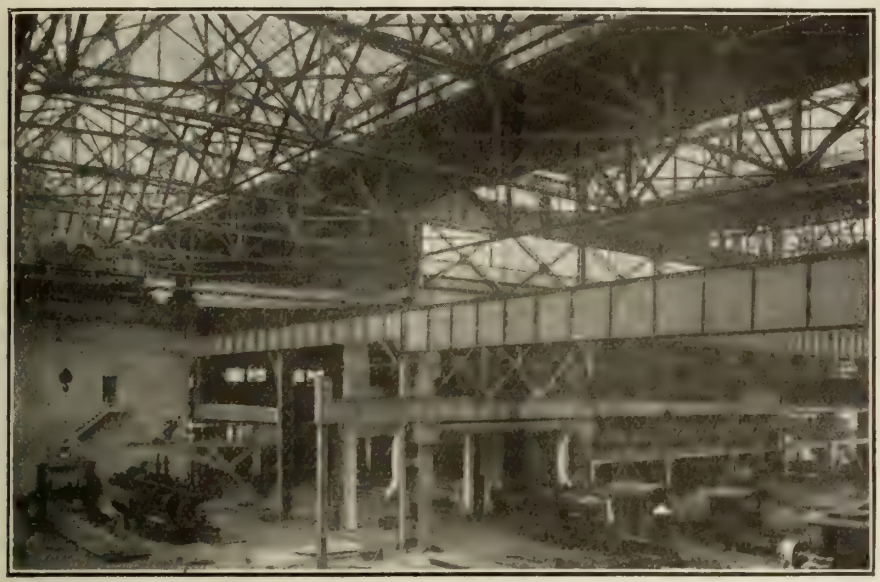

FIG. 3. INTERIOR VIEW OF MACHINE SHOP FROM NORTH-WEST CORNER. Frame Planer and Frame Drill Press in the far Corner. Note Jib Crane near the Drill Press, also 20-ton Cleveland Crane Runway extending into New Machine Shop under Whiting 10-ton Crane Runway.

the limit in height that can be machined. The nominal rating of the machine which drives the planer is 50 h.p. and the motor is of the direct current variable speed type.

This system makes use of a motor-generator set taking the local supply of curent and applying it to a motor which has been designed to suit the available voltage and kind of current. This motor forms the motor end of the motor-generator set, while the generator end of the set supplies the current to the motor which is connected to the driving end of the machine. Any cutting speed can be obtained from about 20 feet per minute to 90 feet per minute.

The return speed is also capable of wide adjustment. Under ordinary working conditions, however, the maximum speed of 90 feet per minute is maintained, but should it be found necessary to machine a particularly heavy piece, practice has shown that it is best to reduce the speed of the return stroke. The great shock given the driving gears and the rack at the end of the cutting stroke is quite apt to break these parts, when the return speed is excessive, with a heavy casting on the machine.

Among the many adjustments is one that allows the tool to enter a cut slowly, then the speed is increased as the tool passes on to the solid part of the cut. This is very useful in breaking cast iron scale when making a roughing cut. The edge of the tool is thus preserved and is able to accomplish a greater amount of work without being reground. Another adjustment is one whereby the tool can be accelerated when cutting air on the cutting stroke, and again slowed down when the tool is about to re-enter metal. One particularly interesting feature of the drive is that when the planer is reversing there are really no signs of a high peak load. The armature of the motor which reverses is so designed that it tends to feed back to the line through the motor-generator set at the time of the reversal, and in this way the tendency toward a peak load is absorbed.

The second planer equipped with this drive is one that was supplied by the London Machine Tool Co., of Hamilton, Ont. An 80 h.p. Lancashire Dynamo & Motor Co. set drives this planer, which has an exceptionally long table but in other respects it is of standard design. It is used almost exclusively for planing locomotive frames. Between the standards and under the cross-head a casting 72 in. square can pass. A small motor on the frame supplies power for raising and lowering the cross-head.

To the south of these two planers is a frame drill press of the multiple spindle type. This machine is driven by a 20 h.p. variable speed Westinghouse motor, and was manufactured by the John Bertram & Sons Co., Dundas, Ont. In the south-western corner of the shop near the cylinder planers is a cylinder drill press with a 6-ft. radial arm. This drill-press was supplied by John Bertram & Sons, and is driven by an 8 h.p. variable speed Westinghouse motor.

The foregoing completes the number of machine tools located in the new shop at present. All are placed on concrete foundations and two additional foundations have been prepared, one for a new frame drill press, and the other for a new cylinder planer. Nevertheless, with the present equipment the capacity of the works has been greatly increased.

The electric energy consumed in the plant is all generated in the company's power house. All power circuits are of 220 volts and are direct current. Each machine tool has its own individual motor drive.

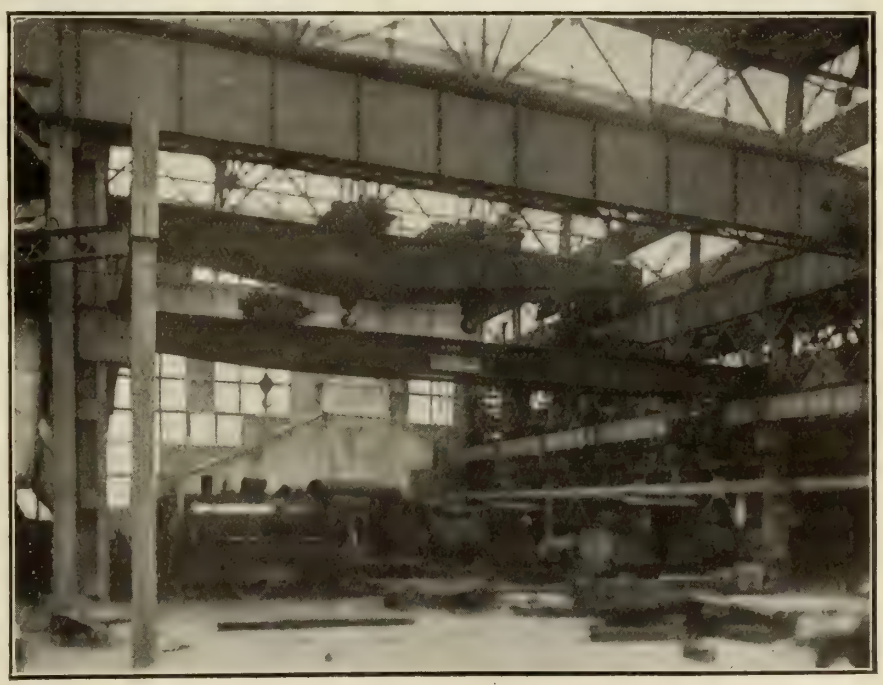

FIG. 4. LOOKING FROM NEW MACHINE SHOP INTO ERECTING SHOP.

**Heating and Ventilation.**

The heating is accomplished through a

system of steam coils located in a small chamber on a mezzanine floor in the north-east corner of the shop. A Sturtevant fan driven by a 20 h.p. Sturtevant motor draws air through the coils and delivers it to all parts of the shop through a system of large galvanized iron pipes. These pipes, at all delivery points, are fitted with regulators and controls. The efficient ventilating system is ably assisted in the warmer seasons by a large number of ventilators in the sidewalls and the monitor.

**Summary.**

With this latest extension, this very progressive institution is in possession of a thoroughly up-to-date plant, and the new management, which upon assuming control of the plant a few years ago, began immediately to lay plans to modernize the plant and equipment, are to be congratulated upon their success, for nowhere now in Canada can the facilities for designing and constructing locomotives be surpassed. Undoubtedly a bright future is in store for this plant when Canadian railway transportation gets back to normal again.

## GASOLINE ENGINE FACTORY LAYOUT

By D. O. Barrett.

THE accompanying floor plan of a gasoline engine factory shows the result of several changes which were made to determine the most convenient and economical method of handling that class of work. This particular plant operated a complete and quite elaborate cost system, which in the first instance was handled from the office, the location of the latter being one corner of the building, with the main entrance at the side. The wash room was also located at the front entrance, together with the lockers for the workmen. In the morning the door A was locked, and B was left open. This caused all employees to pass first through the wash room and then past the time clock in order to get into the factory proper; the idea was for each employee to be in his working clothes and ready to start work before punching the clock.

Due to numerous misunderstandings because of the fact that the men handling the system in the office did not appreciate the conditions in the factory, the entire purchasing, stock keeping, and cost departments were placed directly under the superintendent; the desks of the superintendent, cost clerk and time keeper being shown just outside of the main office. The cost clerk took care of all the purchasing, handling the stock records and all the details of the cost system, and a window was cut in the corner of the main office so that the telephone would be handy either from the factory or office side.

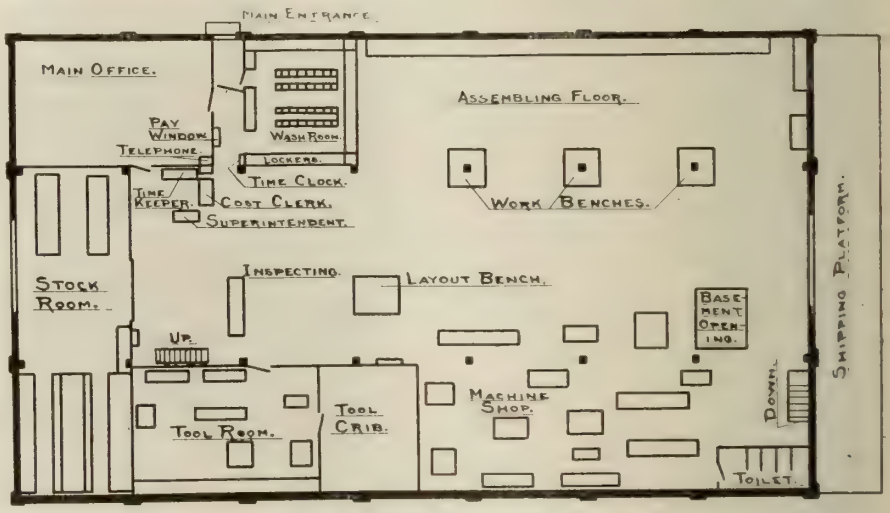
The drafting room had originally been across the street in another building, under the supervision of a chief engineer working directly under the general manager: This arrangement did not, however, work out very satisfactorily, and the drafting room was then placed under the supervision of the superintendent, being moved into the main building, directly over the stock room in the main bay, the stairs shown marked 'up' leading to same. The drafting room was built with glass along the entire side, so that it was possible for anyone in the drafting room to see just what was going on in the factory as well as to notice any shipments, the shipping platform being located at the other end of the building.

The pattern shop was across the street, and a series telephone was provided there also in the superintendent's office and drafting room. This gave the superintendent communication with these two departments without any outside interference. The factory originally had about ten of these series telephones, but the multiplicity of calls was very annoying, resulting in extremely poor service, and eventually the system was abandoned. It was then cut up into two distinct parts, the first of which has just been mentioned and the other comprised the general manager's office, stockroom, basement stockroom and superintendent's desk. This rearrangement of the phone system worked out very nicely and proved to be much more convenient and serviceable than the old method.

The shop time cards, after being collected and sorted by the time-keeper were passed to the cost clerk who arranged them in their proper envelopes, each of which was numbered for its corresponding job in the shop. As soon as a job was completed and the time and material recapitulated on the envelope, same was passed to the office where the proper entry was made in finished stock. All castings were purchased outside and the majority of these were stored in the basement and brought to the machine shop through the basement opening by means of an electric crane which travelled the entire length of the shop.

Having the cost clerk and timekeeper located directly in the factory made it possible to easily keep track of each job passing through and it was also possible to readily locate and determine any error almost as soon as it occurred. All the foremen had ready access to both the superintendent and cost clerk, and any difficulties were reported immediately in person to the proper authority.

The work benches on the assembling floor were placed around the building columns with a vise at either side, each bench accommodating two workmen. As the engines were assembled, they were set into the main bay and then taken to the basement for testing. The entire layout worked very satisfactorily and made it possible for those in charge to look after their respective duties with a minimum of effort.



GASOLINE ENGINE FACTORY LAYOUT.

**Portable Power Hammer.**—A new electro-pneumatic hand hammer, designed especially for riveting and cutting in machine shops and drilling in stone quarries, claims the advantage of portability over the ordinary compressed air hammer, as it can be attached to any lighting or power circuit. A small motor-driven air compressor operated at low pressure is connected to the hammer by a length of armored hose, and rapid admission and withdrawal of air behind the hammer-head piston gives the blows of the hammer. The strength of the blows is adjustable. The complete apparatus is transported to the place desired on a light truck, and an eye bolt on the air-pump provides for suspension at any height that may be necessary.

## MACHINING BRAKE SEGMENTS.

By W. G.

THE accompanying drawings illustrate a simple method of machining semi-circular brake segments of rather delicate design. It was very essential that they should be accurately machined, otherwise, their efficiency as working units would be considerably impaired, and further, the quantity required was insufficient to warrant the outlay of a more expensive set of tools, thus the question of first cost had to be seriously considered. A glance at the drawings will, no doubt, give a clear idea of their general construction and operation.

Fig. 1 is a front and side view of the turning fixture for operation 1, part A being the holder. This consists of a cast iron face plate having steps or projections $A_1$ and $A_2$, the latter being utilized for locating the work. It will be noticed that the projection $A_1$ stands slightly clear of the work, the object being to provide clearance for the turning tool. Parts B, C and D are the stud clamping plate and nut respectively. The whole turning and facing operation is performed at two settings, the first being machining the top and one face and the second consisting of finishing off the opposite face. This completes the turning and facing operations.

Fig. 2 is part sectional elevation and plan of drill jig for the second operation. The jig body E consists of a mild steel plate having formed in its underside a locating recess $E_1$, the object of the latter being to centralize the jig as shown. Parts F and G are the positioning pegs. These are made from silver steel and should be carefully located in the jig body. It is also very essential that they should be made a good tight fit for the holes in the jig body E. The drill bushes H and I are made from best cast steel and are hardened and ground.

With reference to the locating recess $E_1$, it will be seen that the outer side

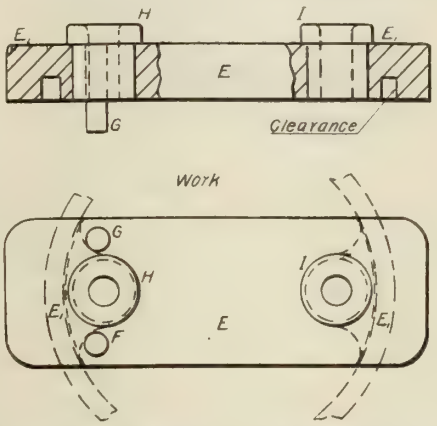

FIG. 2. PART SECTIONAL ELEVATION AND PLAN OF DRILL JIG FOR SECOND OPERATION.

only (largest diameter) is intended to fit the work, the inner side being clearance.

The third operation is performed by an ordinary pin drill or counterboring tool and consists of facing off the lugs. This part of the work is thus machined on its own base which insures the lug faces being true.

The fourth and last operation consists of parting the segments after the completion of the turning and drilling work. The slitting fixture for this is shown in Fig. 3. Part K the base is made from a rectangular cast iron slab and is provided with two central locating pegs L and M. These are made of mild steel and should be case-hardened and ground, care being taken to see that they are a free sliding fit (not loose) for the holes in the work.

Part N is the clamp plate which is made from a piece of flat mild steel bent over at the one end as shown. Parts O and P are the clamping stud and nut respectively. Part R is the supporting spring for the clamp plate, its object being to prevent the said plate from falling when clear of the work.

The sequence of operations is as follows: The work is first dropped into position on the pins L and M and the clamp strap N is slid forward over the work and secured in position by means of the nut as shown. After the one side of the segment has been cut through, it is reversed and the same operation applied to the other side, thus entirely completing the machining.

## DEVICES FOR FINISHING SPHERICAL SURFACES.

By Avery E. Granville.

THE devices and machine attachments for the finishing of spherical surfaces are almost innumerable, for nearly every shop doing any range of work has to meet the question at some time or other. Oftentimes a formed tool will solve the problem, but many times the nature of the work prevents. One great trouble with most formed tools

used for this kind of work is that the cut is too great and has a tendency to chatter at a critical time. However, where the surface does not have to be a true curve, or where only commercial accuracy is required, a formed tool is often the best thing to use. It is not the intention here, however, to describe or show any of the various types of formed tools that might be used, but only devices a little out of the usual run, that have been made in shops in different parts of the country.

### Turning the End of a Ball Lever.

The first example shown in Fig. 1, is the turning of a ball lever. This lathe attachment is in use in the shop of a prominent automobile maker. The lever is a forging, which is chucked between formed false chuck jaws, as shown. The turning device is bolted to the cross-slide of the lathe in place of the usual tool-block. The turning tool A, is carried in a revolving block set into the holder B. A slide in the face of the block, which is adjusted by means of the screw C, makes it easy to set the cutting tool as needed. The tool block is revolved by turning the ball crank D, which turns a worm meshing with a worm-gear at the back of the block. This device turns a perfect ball, and gives a well finished surface.

In direct contrast to this device is a tool used by another firm in exactly the same line of business. This tool is shown in Fig. 2, and consists simply of a hollow, cylinder, hinged to a suitable shank. The notch A is cut in it to admit the neck B of the lever that is turned. The lever is chucked as shown in the first example, and the tool is placed in an ordinary tool post and fed straight in. The face of the cylinder is slightly beveled away from the inner edge, so as to form a sort of scraper. The amount of metal removed is not great, and the result is all that the company requires for this class of work.

### Grinding a Ball.

The balls used in ball and socket joints as a rule have to be pretty accurately finished. A big engine building company grinds theirs on a grinder fitted as shown in Fig. 3. The ball and shank are centered and turned to approximate size. A collar A is then clamped on and the piece mounted between centers as shown. The centers are mounted on a long table which is swiveled on a pin exactly under the center of the ball to be ground. As the work is turned by the belt B, running in the attached collar or pulley, the operator swings the table slowly around and feeds in the wheel C in the ordinary way. A fitted ball and socket are shown at D. Threads are cut on the shank after the ball is ground. This is done in a lathe, using the type of dog shown in Fig. 4. The ball is clamped between the cups E and F, with the tail G outward. The socket parts are bored out with the type of tool shown at H.

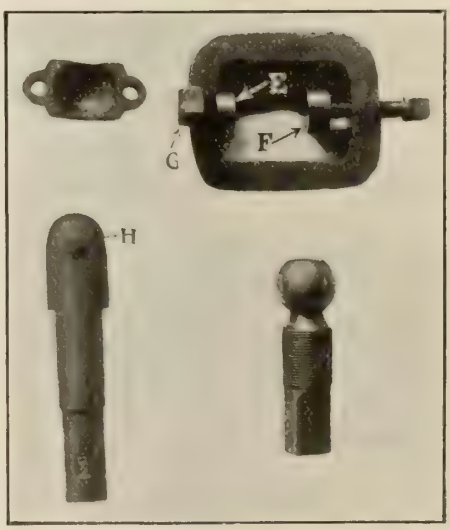

FIG. 4. SPECIAL DOG AND SOCKET BORING TOOL.

**Ottawa Machinists.**—What proved to be a very interesting meeeting of the local machinists was held on Jan. 20. There was a large attendance, and through the presence of a grand lodge officer, in the person of Vice-President McLelland, much valuable information was gained by the members, who were pleased to learn that the industrial outlook in relation to the craft was brighter than for some time past. The interesting feature of the evening was the election of office bearers. This event was a few weeks behind scheduled time, owing to some of the old officers being given time to reconsider their attitude in declining nomination. After a spirited and keenly contested election the following were elected:—President, L. M. Landsky; vice-president, W. Riddel; financial secretary, A. Fulton; recording secretary, J. Burnie; treasurer, R. Steel; conductor, G. Sweet; sentinel, M. Paynter; auditors, Messrs. Gillespie, Carson, Barrett; trustee, J. Teange. After election the new officers invited the members to participate in a social evening to be held at the next regular meeting. This will also take the form of a joint installation with the officers of Local 412.

**The Algoma Steel Corporation** of Sault Ste. Marie, Ont., has opened an office in the McGill Building, Montreal, in charge of G. A. Irwin.

## THE ROMANCE OF COPPER.

IF there is one metal in the world upon which general attention is riveted it is—next, of course, to gold—copper. Its increasing necessity to industrial development and its comparatively restricted occurrence have long rendered it a metal which came peculiarly within the scope of the financial operator, and now, when the law of supply and demand was regulating itself on lines of economic stability, and copper was becoming less of a speculative medium and more of a prosaic commodity of ordinary commerce, there comes the war to emphasize at once its special utilities, and at the same time its unequal geographical distribution.

### Copper in Early Weapons.

Time was when Britain ruled the world of copper as she rules the seas. The weapons and the armour which the ancient Greeks and Trojans used in their sanguinary combats were of copper, and as likely as not British copper at that. The Roman warrior or his craftsmen contemporaries knew a little more than Homer's heroes, for his sword was made of the alloy bronze, really a mixture of copper and tin, such as later was made into another type of death-dealing instrument and styled gun metal. The average Roman sword blade consisted of 91.4 per cent. of copper, and the remainder tin; while the English 8-pounder cannon in vogue before the wired steel gun came into existence contained 91.66 per cent. of copper and the balance tin. When man discovered how to work iron, copper had less "military significance," but it was again pressed into service as bronze or gun metal when the Chinese (or Roger Bacon) or some other benefactor of the human race found out the slaughtering properties of a certain explosive powder. In the meantime copper had been largely used for more peaceful purposes, and so it has been throughout the history of civilization.

### Copper Smelting in Britain.

Copper is the metal which has been prominently identified with the arts of peace—and war. Somewhere round the year 1500, perhaps earlier, smelting works were established at Neath, and a hundred years or so later the smelting industry was firmly seated at Swansea. There were also smelting works in Staffordshire and Lancashire, but Swansea easily led the way, just as the Cornish mines did among the supply sources. At the commencement of the nineteenth century the output of refined copper from the Cornish mines was close upon 5,000 tons, Anglesea ores being responsible for another 2,000 tons. This 7,000 tons constituted 75 per cent. of the world's output, yet a hundred years later the same mines only produced the almost negligible quantity of 550 tons. In the interim the smelters of Swansea quite realized what the discoveries of easily procured copper abroad meant, and they imported vast quantities, so that from 1850 to 1860 the Associated Copper Smelters of Swansea enjoyed a monopoly.

### Copper Smelting Abroad.

Such a condition of things, however, could not long continue. New sources of supply were rapidly being exploited. In 1830 Chile was sending large consignments of copper ore to South Wales, and in 1842, in order to achieve a more liberal profit than that allowed by the monopoly, the Chilians commenced to smelt for themselves, with the aid of expert workers from South Wales. The same year saw the Kapunda and Burra Burra mines opened, and in 1844 the copper resources of the Lake Superior area were exploited. In fact, copper was systematically searched for the world over, and side by side with this extensive development of the supply field there were new processes for the recovery of copper from waste ores, with the result that the refuse of earlier workings was made to yield a rich harvest, and mines which had long been shut down were reopened.

### The Speculative Feature.

Naturally, the exploitation of new sources of supply and the failure of old have contributed not a little to foster the speculative spirit in copper trading. The Swansea smelters managed to ensure high prices in the 'fifties, and the Secretan Syndicate in 1887-9 aimed at absolute control of the copper supply, and actually controlled 85 per cent. of the world's output. Such a corner as this necessitated a huge expenditure, the Comptoir d'Escompte loaning the syndicate over six millions sterling. Copper went up from 11 cents to 18 in a month. Fortunately, there was one source of supply which the Syndicate had overlooked, and as prices rose arbitrarily consumers refused to buy and preferred to wait until the old copper and bronze, etc. collected from heterogeneous sources, was re-smelted. The quantity of copper forthcoming from this scrap was such that the Syndicate had to climb down. From over £100 per ton, copper had dropped to £70, and then it fell to £35 in a single day ; the corner collapsed ; and, of course, the Syndicate had to face financial ruin. Another effort at controlling the world's copper—that of the Amalgamated Copper Company, of the United States—was also unsuccessful.

### World's Annual Supply

The world's annual supply of copper is now over one million tons, of which the United States produces over 600,000 tons. Mexico is responsible for about 75,000 tons ; Japan and Spain and Portugal produce about 60,000 tons; Australasia about 50,000 tons; Chile, 40,000 tons; Canada and Russia, about 35,000 tons; Peru, about 30,000 tons; and Tanganyika, whose deposits are said to be both rich and extensive, 20,000 tons. With the exception of Spain and Portugal the copper requirements of European countries have to be made up by importation. If there is an exception, it is Norway, whose mines produce about 12,000 tons. Italy produces 2,500 tons, and Austria about double that amount. Germany's output, however, is about 25,000 tons, which is probably one-eighth of the quantity she consumes. Austria's annual consumption in normal times is about 35,000 tons.

### Requirements Arising From the War.

What the requirements of these countries are now it is impossible to say, but they must be enormously greater. No copper means no bronze, no brass, no gunmetal, and hence no material for the scores of purposes for which it is used in war material, whether ashore or afloat; and over and above this,, no copper means a very serious restriction of the manufacture of electrical appliances for field telegraphs and field telephones, appliances for which copper is a prime necessity. Copper is thus to a great extent vital to a nation conducting a latter-day war, and hence the whole civilized world is interested in the question of whether or not Germany will be enabled to replenish her supplies. Of course, the position of the United States is quite intelligible. They are business people and they produce somewhere in the neighborhood of 60 per cent. of the world's output. They are desirous of doing business as usual, and perhaps naturally, do not wish to understand why, because two nations are at war, one should prevent the other receiving United States copper. In this connection it is certainly significant that, while Germany should receive 140 million pounds of copper from the United States, Holland, which is hardly a manufacturing country, should have received over 200 million pounds of American copper in the same year. The propinquity of Rotterdam to the Rhine instantly suggests itself, as also does the fact that Italy is neighbor to Austria. The copper trade of neutrals with easy access to Germany has increased enormously. The ultimate destination of their abnormal importations is obvious, and English statesmanship will be failing in its duty to civilization if it allows the common enemy of humanity to receive ad lib so prime a necessity to the prosecution of his unjust war.—Syren and Shipping.

# Series of Practical Questions and Answers for Mechanics

*Every care is being taken to include only pertinent, practical questions, and give same direct reliable answers. Catch questions will be avoided. Arithmetic, consisting of simple addition, subtraction, multiplication and division will be found a useful companion study.*

## RIVETED JOINTS.—II.

THE joints commonly used for longitudinal seams in boiler work are the double-riveted and triple-riveted butt-joints with double cover plates. Quadruple-riveted joints are also used to a considerable extent for high-pressure work and large boilers. It is easily seen that a more efficient joint means that the thickness of the plate can be reduced, and in a large boiler this saving may easily pay for an extra row of rivets.

The inside cover plate may be made wide enough to take in all the rivets, while the outside plate is made narrower so as to miss the outside row of rivets. Lap joints are used only on girth seams for good work, as they become weakened by continual use. This weakening is caused by the twisting and bending effect of the lap joints when under strain and its subsequent return to the original shape when the strain is removed. The best spacing for different types of riveting can be found for all thicknesses of plate in the various mechanics' handbooks. For double-riveted joints it is customary to locate the first row at very nearly the minimum spacing and the second row at double this spacing, the rivets of the second row coming opposite the spaces in the first row. In triple riveting the front two rows are usually spaced alike, but further apart than the front row of the double-riveted joint, the rivets of the third row being spaced at twice the distance. The spacing of the outer row of rivets must not be too great to allow of properly calking the joint.

* * *

**Question.**—A riveted joint is made up of 1 inch plates, two cover plates and a single row of 1¼-inch rivets spaced at 3 inches. How close to the edge of the plate could the rivet line be placed so that the shearing strength of the plate would still be as great as the shearing strength of the rivet?

**Answer.**—The shearing area of the rivet $= 1.25 \times 1.25 \times .7854 \times 2 = 2.454$ sq. in.

The shearing area of the plate per inch is 2 sq. in. The length required then is $\frac{2.454}{2} = 1.227$ inch, or the rivet line would have to be approximately 1¼ inch from the edge. The custom of placing the rivet line 1¼ diameters from the edge of the plate, therefore, gives ample strength.

**Question.**—In a single riveted butt joint with a single cover plate, 1-inch plate and 1⅜-inch rivets, what should be the spacing in order that the tensile strength of the plate be equal to the shearing strength of the rivets?

**Answer.**—The pitch of the rivets less the diameter of the rivet hole multiplied by the tensile strength of the plate must equal the shearing strength of the rivet, or $P-1\ 7\text{-}16 \times 54{,}000 = 1.4849 \times 50{,}000$; or $P-1\ 7\text{-}16 = \frac{1.4849 \times 50{,}000}{54{,}000} = 1.374$ inches; or Pitch $= 1.374 + 1.4375 = 2{,}8115$ inches, or approximately 2 13-16 inches.

* * *

**Question.**—In a 60-inch boiler carrying 75 pounds pressure, and for which ¾ rivets are used, what should be the rivet spacing for the girth seams using a safety factor of 6?

**Answer.**—The total pressure tending to separate the boiler endways is $60 \times 60 \times .7854 \times 75$. Shearing strength of one rivet $= .4418 \times 50{,}000$. Number of rivets required $= \frac{60 \times 60 \times .7854 \times 75 \times 6}{.4418 \times 50{,}000} = 59$ approximately. Circumference $= 60 \times 3.1416 = 157.08$. Spacing $= \frac{157.08}{59} = 2.66$ inches, or, say, 2½ inches.

* * *

**Question.**—Considering that the whole strength of a diagonal stay tends to shear off the rivets at the end, how many ¾ rivets would be required for a stay, the weakest part of which is 1¼ inches in diameter.

**Answer.**—The tensile strength of the bar is $1¼ \times 1¼ \times .7854 \times 54{,}000 = 66{,}269$ pounds.

The shearing strength of a ¾ rivet $= .4418 \times 50{,}000 = 22{,}090$ pounds.

The number of rivets required is $\frac{66{,}269}{22{,}090} = 3$ very nearly.

* * *

**Question.**—Design the riveting for the longitudinal seam and find the plate thickness for a cylindrical steel water tank 60 inches in diameter for a pressure of 50 pounds per square inch.

**Answer.**—In a problem such as this there are several unknowns, such as plate thickness, rivet diameter and rivet spacing. It is customary to give trial values to one or more of them as experience dictates, and from these calculate the others. Test calculations are then made to see that these values are such as to give the greatest efficiency.

The tension per inch on the seam is $\frac{60 \times 50}{2} = 1{,}500$ pounds. With a safety factor of 6, a tensile strength of material of 54,000 pounds per sq. in., and assuming a joint efficiency of 50 per cent., the thickness of the plate required is $\frac{1{,}500 \times 6 \times 100}{54{,}000 \times 50} = 1\text{-}3$ inch, or, say, ⅜-inch plate.

There are a number of rules for determining the size of the rivet. One often used for smaller sizes is that the diameter of the rivet is made ⅜ of an inch greater than the plate thickness. Likewise, assume a pitch of 2.5 diameters. The joint now becomes a single riveted lap joint with ¾ rivets spaced at 1⅞ inches.

The shearing strength of the rivets per inch of joint $=$ Shearing strength of rivet $\times$ area of rivet $\div$ Pitch. or $= \frac{50{,}000 \times .4418}{1{,}875} = 11{,}991$ pounds.

The tensile strength of the plate between the rivets is Tensile strength of plate $\times$ Thickness $\times$ (Pitch—Rivet Dia.) $\div$ Pitch. $= \frac{54{,}000 \times .375 \times 2.5}{1.875} = 16{,}200$ pounds per inch.

These dimensions, therefore, make the rivets much weaker than the plate. Decreasing the pitch to 1.75 inches, which is as small as we can conveniently make it and still have plenty of room for the riveting tool, we get for these values 12,620 and 15,911 pounds. The efficiency of this joint is the weaker of these divided by the strength of the uncut plate per inch, or $\frac{12{,}620}{20{,}250} = 62.3$ per cent.

On account of the bending action of the lap joint, the actual efficiency would not run as high as this.

* * *

**Question.**—In the above problem what would be the effect of putting in another row of rivets behind these and at double the pitch?

**Answer.**—The shearing strength of the rivets is half as much again, or is

$$12{,}620 \times \frac{3}{2} = 18{,}930 \text{ pounds.}$$

The tensile strength of the plate becomes that between the rivets, in the outer row which is

$$\frac{2.75 \times .375 \times 54{,}000}{3.50}$$

$= 15{,}906$ pounds per inch of length.

Efficiency becomes $\frac{15{,}906}{20{,}250} = 78.5$ per cent.

The thickness of the plate could be decreased and the pitch of the rivets increased, tending to make the tank much lighter.

## WELDING GALVANIZED AND TIN PLATES.

INQUIRIES are frequently made as to the possibility of obtaining satisfactory welds on plates or articles that have been galvanized or tinned. In most cases the welds obtained are excessively brittle, and in the case of welding galvanized material, the health of the welder is seriously affected by the fumes produced under the action of the blowpipe. It is therefore necessary for the welder to know the difficulties he has to contend with, and the methods to adopt in order to produce satisfactory welds on these materials.

### Galvanizing.

Zinc forms a cheap and excellent protective coating for iron and steel. It has the great advantage over tin and lead in being attacked in preference to the iron when the two metals in contact with each other are exposed to corrosion. For most articles zincing—or galvanizing, as it is wrongly called—is most cheaply and conveniently applied by dipping the iron or steel articles in a bath of molten zinc. Previous to dipping the articles are cleaned by acid and friction, coated with a flux of sal-ammoniac and heated. With certain articles this method has disadvantages; for example, in large objects, tanks for instance, it is difficult to heat the molten zinc evenly, besides the bath would have to contain many tons of zinc. In these cases, the depositing of the zinc electrically, known as electro-zincing, has marked advantages. The zinc is deposited cold, and does not alloy appreciably with the surface of the iron to be protected.

The application of oxy-acetylene welding to finished galvanized articles is the exception rather than the rule. There are cases where, owing to the distance from a galvanizing plant, articles are constructed from galvanized plates and oxy-acetylene is applied during the construction. In other cases, the blowpipe is frequently applied to correct defects of manufacture, for example, welded or riveted tanks which have failed under hydraulic test. Lastly, the blowpipe is an indispensable tool for the repair of galvanized articles.

### Galvanized Plate Welding.

In welding galvanized plates numerous precautions are necessary. The white jet of the blowpipe in contact with the plates produces abundant vapours and oxide fumes. These can interfere with the course of the work and, more important, seriously affect the health of the welder. Without proper preparation, the welds always include as impurities, zinc and slag, and the mechanical strength and soundness of the welds are directly dependent on the amount of such slag and zinc incorporated into the iron whilst molten.

The operation of hot galvanizing produces at the surface of the galvanized plate a layer of pure zinc and a series of intermediate alloys of iron and zinc, rich in zinc near the surface and rich in iron where the alloy comes in contact with the plate. As already indicated in describing the operation of cold galvanizing or electro-zincing, the zinc does not alloy appreciably with the surface of the iron. Under the action of the blowpipe the layer of zinc near the surface is volatilized, but this is not the case with the layer of alloy in contact with the iron or steel plate. Part of the alloy is dissolved in the iron, but the greater part forms a well-known earthy slag, and it is difficult to avoid its incorporation in the weld. The effect of including the zinc-iron alloy is to produce a very brittle weld, and the effect of incorporating the slag is to produce a defective weld with a consequent loss of strength.

### Zinc Removal Imperative.

It is obvious that to produce good, sound welds on galvanized articles, it is necessary to remove the zinc from the vicinity of the weld. The zinc should be entirely removed for a distance of 1 in. to 1½ in. on either side of the centre line of the weld. This preparation makes the cost of the weld higher, and many firms neglect this precaution. Where the strength of the joint is of small importance, the direct application of the blowpipe may be sufficient. In such cases the health of the workman should be considered, and a suitable respirator be provided together with a plentiful supply of milk as an antidote. The plates should be bevelled as soon as the thickness reaches ⅛ in., otherwise burning of the iron and lack of penetration are sure to result.

The welding rod should be of Swedish iron, of dimensions appropriate to the thickness to be welded, and the power of the blowpipe should be that given for the welding of iron and steel plates of identical thickness, that is, the hourly consumption of acetylene should be 240 to 320 litres (8½ to 11 cubic feet) for every ⅛ in. thickness to be welded. The removal of the zinc in the vicinity of the weld also removes the protective covering and it is not usual to replace it by re-galvanizing. The superiority of zinc over other protecting metal coatings is important in this case as it is possible for the exposed iron to be protected by the surrounding zinc. It is advisable, however, to clean thoroughly the welded parts and paint them with a protecting paint having an aluminium base.

### Tin Plate Production.

Tin plates are sheets of iron coated with a very thin film of tin. The manufacture of tin plate consumes the larger part of the world's output of tin. The plates resist the corrosive action of salts and acids, and tinned articles are commonly met with in practice. The process consists in annealing, washing, pickling and rolling the plates to get a good surface, they are then coated with tallow or balm oil previous to dipping in a molten bath of tin. The tin readily

### CAPTURING TRADE

**"Many people speak and write about capturing German trade, as if it were a merchantman just off the coast, which could be taken by one of H. M. gunboats," says a correspondent of the Building News, London, England, in a communication to that journal. "Trade really means the exchange of services, and as a matter of fact in the light of recent experience, the idea of capturing German trade has really become a back number.**

**"It is," he says, "ridiculous to talk of capturing foreign trade when we cannot retain our own trade. The lesson we have to learn is that we have paid a great deal too much attention to matters abroad and neglected—criminally, in my opinion, neglected—our own home affairs.**

**"We are building up foreign trade on paper that the first breath of adversity scatters. The wise man of old was right: 'The eyes of the fool are in the ends of the earth.' When we build our trade as most of your readers build their houses—for home consumption—we shall arrive. Then the Kaiser will have nothing to fight about."**

alloys with the iron at the surface of contact, and a thin film of tin adheres to the alloy. Alloys of iron and tin, even when only traces of tin are present, are extremely brittle hot or cold.

**Tin Plate Welding.**

In the oxy-acetylene welding of tin plates, the tin is not eliminated as a vapor or as oxide fumes as in the case of zinc. Although tin melts at a low temperature (450 deg. Cent.), its vaporizing point is in the neighborhood of the melting point of steel (2,790 deg. Fah.), and further, the tin does not separate from the iron, but is entirely absorbed by the iron as soon as the latter reaches red heat, so that when the iron becomes melted by the blowpipe the iron-tin alloy is added to the molten bath. The result is that the weld consists of very large crystals, which are separated by numerous fissures or cracks.

In endeavoring to weld tin plates without preparation, the welder observes cracks forming behind the blowpipe during the execution of the weld. These cracks are produced by the expansion and contraction strains. For ordinary welds on iron and steel plates, these strains are either negligible or easily overcome, but in the case of tin plates they are sufficient to break up the structure of the iron-tin alloy which is formed during the course of welding. It is, therefore, absolutely impossible to weld tin plates satisfactorily without first carefully removing the tin from the line of welding and its immediate vicinity in the manner indicated for the welding of galvanized plates. The instructions given for obtaining satisfactory welds on galvanized plates hold good for tin plates.—Acetylene Lighting and Welding Journal.

**Canada's War Orders.**—Something of the truth of the statement made at the annual meeting of the Dominion Bank by Sir Edmund Osler in Toronto to the effect that Canada is being assisted rather than injured by circumstances arising out of the war may be gathered from the following figures representing approximately the orders of the British War Office agents for Canadian goods placed since the war commenced:—

| | |
|---|---|
| Textiles and woolens | $8,000,000 |
| Boots and shoes | 9,500,000 |
| Shrapnel shells and cases | 25,000,000 |
| Remounts | 4,000,000 |
| Harness and saddlery | 3,500,000 |
| Rifles and ammunition | 2,000,000 |
| Hardware of various kinds | 2,250,000 |
| Tinned meats | 1,000,000 |
| Canned goods | 900,000 |
| Clothing | 8,000,000 |
| Lumber | 1,000,000 |
| Miscellaneous | 20,000,000 |
| Total | $85,150,000 |

# Observations and Comments on the Commonplace*

By John C. Jay, Jr. **

*The accompanying article is neither more nor less than a plea for the greater display of business courtesy, and in order to accentuate the appeal, our actions and attitude in the social and domestic sphere are shown to reflect unfavorably on those generally practised in our business and its kindred relationships.*

THESE are comments on the commonplace, the humdrum of every day routine, the small details of administration and personal conduct, which consciously or unconsciously must be worked out in every household or organization.

Each of us in the everyday regulation of our homes and individual lives gives some thought to the proper conduct of these homes, so that we may not be thought wanting in the generally accepted standard of the world for that station in life in which we move. The standard of living requires certain conditions from us which we must live up to, or else we suffer in standing in the eyes of our neighbors.

**Inconsistency Marks Us.**

It is a strange thing that the average man should feel that the minute he approaches his everyday business problem, a rather different standard is necessary, or rather, that no standard at all is required. An experience of somewhat over ten years as a salesman on the road and in the office, and in the daily running from one establishment to another in the pursuit of business, has forced home this unwelcome conclusion.

It is rarely that one comes upon an office that would measure up to the ordinary standards required and observed in private life. The man who is most scrupulous in his own home that his door bell be properly attended that the visitor within his gates shall be received with respect and courtesy, is particularly lax in these very matters where his business life is concerned. The slovenly slattern is not tolerated at the home door, nor would the average business man permit an untidy and often insolent boy to receive his visitors, but the gateway to the average office is manned by the cheapest of help, who eyes the visitor with intolerance and suspicion.

**The Business Feature.**

We go to see Smith in his house, and are ushered into the parlor, while Smith in his office permits us to warm a bench, if he has happened to think long enough to provide one. A wooden barrier with swinging gate securely locked by mystic mechanism, keeps us in our proper place, while the youth within fingers our pasteboard with grimy thumb, and asks us the nature of our business. The fact that our business with Smith may be of his own seeking, or the fact that we may be doing Smith a favor by our call, as a rule causes no discrimination. Smith, utterly unconscious, sits serene, far removed from the common rabble, behind a door, the heavy letters on which proclaim he must be "private."

**No Monopoly Represented.**

Our imaginary Smith is, I think, fairly typical. There is not a salesman who reads this article who does not number many Smiths among his acquaintances. Yet, strangely enough, Smith himself when finally reached is very human. He has the ordinary manners and the ordinary standards of the average man. He would probably be very much astonished if he knew the small tumult of anger he has unconsciously caused in our mind as we approach him. Yet the little scene in the front parlor of Smith's office is occurring every day in thousands of offices in every city in this country where business is being done. The cheapest help is put at the entrance gate of the business concern, which with its entire organization and its heavy advertising expense, is seeking customers.

The writer never sees the inevitable wooden barrier but that he asks himself the question, why, why, why, is it there? Through every intelligent means at its command, the company has made an effort to make itself known, to welcome custom, yet the first impression anyone entering its door receives is that entrance cannot be gained without proper credentials. For the sake of teaching the life insurance agent his place, of repelling peddlers and stopping the occasional deadbeat, an elaborate system is erected, that for stupidity cannot be matched, for while seldom excluding the really clever rascal, the self-respecting man on legitimate business bent is insulted and annoyed, and not infrequently excluded.

It is often urged that to provide suitable accommodations for visitors, in the shape of some proper waiting room, is costly and a waste of valuable space; in fact, so general is this opinion that the usual practice in large corporations is

*From Frog Shop Digest, Pennsylvania Steel Co.

**General Manager of Sales, Pennsylvania Steel Co.

that the visitor sits in what is usually the large working room or office, carefully kept in his proper place by a railing, and waits his turn to reach the man in the private office beyond.

**Experiences of the System.**

Not many years ago the writer was thus waiting his turn in the office of a large railroad, amid the clatter of many typewriters, and the hum of routine conversation inevitable in such a place. As he sat there, two clerks were calling off price lists to each other, for purposes of checking, thus giving him the very information as to his competitors' prices which the purchasing agent under no conditions would permit him to see.

Another experience also in a large railroad office, after a disastrous wreck, gave him information of a nature so confidential that no one outside of their legal department had any business to have knowledge of it. Under the ordinary practice existing in most offices, instances such as these must be the rule and not the exception.

**Big Concerns the Biggest Sinners.**

The larger the corporation, the less attention is given, as a rule, to these matters. The sense of individual responsibility does not extend to what many call a trifling and petty detail, and what is the business of all, becomes the business of none. The executive, the door of whose private home is faultlessly served, gives never a thought to the front door of his counting house, through which his income flows. Smith at home and Smith in the office have little in common.

**The Personal Application.**

We have been criticizing our good friend Smith because we feel he has not been running his business and reception room quite to suit our natures, possibly over-sensitive. To-day, however, Smith is a buyer, and with that sense of importance which always goes with ability to purchase, he has called upon us to see what trade he can make to mutual advantage. So that to-day the shoe is on the other foot, and Smith has come to us instead of our having to go to Smith.

I wonder if our sales offices and salesmen have ever stopped to study just the mental process which our good friend Smith goes through under these reverse conditions. In other words, does Smith find our own office intelligently manned at the entrance, and is he made to feel that he is welcome, and that of all places our office is the one where he will be intelligently served?

**Distinctive Treatment Provision**

Here again we find a ready standard of comparison between our individual life and home and our daily business routine. Were Smith to call on us at our house, we should get up—more, we should go half-way to greet him, and after the call was finished we would accompany him to the door as a matter of course. If we were living in the modern aparatment, merely a domesticated office building, and Smith were more than a chance acquaintance, we should probably show him the little courtesy of going to the elevator to bid him God speed. In our house we would feel that we were his host and would take pains to exercise the tact which is necessary to translate visitor into guest.

There is of course a ready distinction, and a very real one, to be made between our different callers at home and in the office. We make it quite naturally and unconsciously in our home as between the neighbor and the gas inspector. We may, therefore, make it quite properly in the office, but to our sales offices each stranger may be a customer, and as such he is to be welcomed on behalf of the corporation we serve.

**Politeness Pays Dividends.**

As a rather small boy the writer once was taken by his father on a business errand to the Chemical National Bank in New York, presided over at that time by a gentleman of the old school, whose traditions still linger in that particular bank. This bank, one of the oldest and one of the wealthiest in the country, serves an army of clients. What particularly impressed the writer as a boy was that at the close of the business in hand, this very busy bank president left his private office and walked to the door with us before the farewell was said. It was his universal custom.

The stories that grew up around this man were many. Even while talking to a client his eye took in the general coming and going in the bank, and if he saw any person not receiving prompt and courteous attention, the surprised depositor or borower might find himself being waited on by the president himself. A constant phrase of his to his clerks was "politeness pays dividends."

**Each Salesman Reflects His Employer.**

Each salesman is a point of contact with many individuals. It is the individual salesman more than any other man who fixes the standard by which a corporation is judged. He can reflect the character and policies of his company, and the company in turn is largely known and judged by his particular standard of conduct. Each in his small individual field is the creator of a certain amount of public sentiment, which in the aggregate approximates the whole. The analogy between a large corporation and a government is obvious, and in this analogy the sales department of any large corporation corresponds closely to the diplomatic corps which any large government maintains.

**The Business and Diplomatic Analogy.**

In the diplomatic world, forms and formalities, customs and precedents, play a far more important part than in ordinary business life, yet the distinction is only a matter of degree. The diplomat or foreign representative who chooses to ignore these usual customary forms and formalities, no matter what his personal ability, creates an unfavorable impression, which in turn reflects discredit upon the country that has selected him as its representative.

So in turn, the salesman who thinks that perhaps it is unbusinesslike and shows lack of "hustle" to carry the standard of his every day life and manners at home into his business, makes a mistake and creates an impression, which if it represents the point of view of all, cannot fail to create a public sentiment detrimental to the corporation which employs him, proportionate exactly to the number of customers that salesman serves.

Of little value to a government is the high-sounding expression of friendship expressed in an arbitration treaty, if nullified in submission by the methods of a "shirt sleeve" diplomacy. Of little value are plant investment and business efficiency, if the salesman presenting these fails to make the proper approach.

**A Reformation Call.**

So let our own house be set in order. Let us reform our good friend Smith without his knowledge, for that is tact, and tact is salesmanship. By all means keep our own doors wide open. The open door spells welcome and dispels distrust. If we are tied up and busy (and even a salesman is busy and tied up at times), our visitor is entitled to know it promptly, for perhaps his business is quite urgent and his time quite limited. Let us dust and polish and furbish, that Smith may find pride of good housekeeping in our offices as well as our homes. Let us relegate the barrier gate and the truculent greeting to the period, long past, when flaunting suspenders and hatted head were badges of forced draught office activity.

**Port Arthur, Ont.**—Goods made in Canada will be given preference by the British Empire Industrial League, and goods made in Great Britain the next choice, according to an official communication received by Secretary Goodier, of the Port Arthur Board of Trade, from the headquarters of the league in London, England.

# PROGRESS IN NEW EQUIPMENT

## A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

### NEW DESIGN BORING MILL WITH CENTRE BORING HEAD.

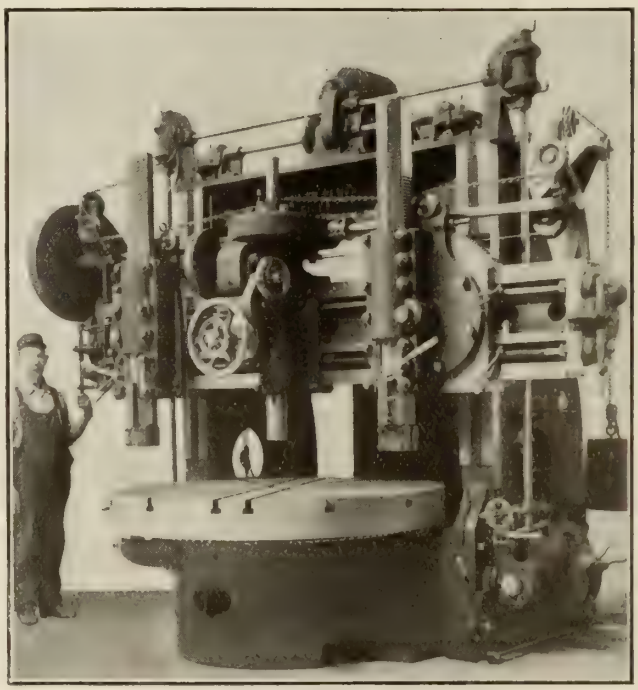
THE accompanying illustration shows the latest design 73 in. Niles boring and turning mill, equipped with centre boring head. This head is mounted on the rail between the two regular heads and is provided with adjustment along the rail by means of rack and pinion. The centre boring head can be traversed to the left, and the right hand regular head brought to to the centre of the rail and vice versa for the left hand regular head.

The spindle of the centre boring head is driven by a motor of three to one speed variation, mounted on the left hand end of the cross rail. Three positive feeds are provided, controlled by pull pin, conveniently located on the head. Spindle has rapid traverse by large hand wheel. On the horizontal driving shaft there is provided a clutch which disengages the drive from the centre boring spindle without rotating it. This is sometimes desirable when finish boring is done with the table revolving and the centre boring spindle stationary.

Centralized control is a prominent feature, all changes of feed and reversal, rapid power traverse or hand adjustment of saddles and bars, also cross rail adjustment and table control being within reach from the operator's position. One lever disengages feed, engages fine and coarse feed and operates fast traverse in either direction. A rapid power traverse to saddles and bars in either direction is provided, while hand adjustment of saddles and bars is by automatic releasing ratchets located at the sides of the saddles.

The whole machine is self-contained, no part extending below the floor line and no special foundation being required. The housings are of box-girder form, double webbed and broad-faced, without openings in front face between the housings. They are securely bolted to bed, and firmly tied together at the top by a heavy brace. The table is deep, strongly ribbed and supported by an annular bearing of large diameter running in a bath of oil, and is driven by a coarse pitch bevel gear, accurately cut, of maximum diameter and wide face. The surface of table has four pairs of parallel and eight radial T slots.

The table spindle is long and of large diameter, and is maintained in strict alignment by an upper and lower bearing. The former is bored out of the solid bed and fitted with an adjustable taper bush to take up wear. The lower bearing is bronze bushed. On the end of spindle is an adjustable threaded collar to prevent lifting. The cross-rail is of the 3-track type, having screw guide at the bottom with saddle traversing screw located between the guiding surfaces, giving the best possible condition for accurately guiding saddles. The cross-rail is box girder in form, broad faced, and of great depth to effectually resist heavy cutting, and may be readily clamped to the housings. Power adjustment is provided.



NEW DESIGN BORING MILL WITH CENTRE BORING HEAD.

The saddles have wide bearings on the cross-rail, accurately scraped, with provision for taking up wear by means of taper gibs. A clamp bolt is provided for clamping each saddle when bar is feeding. Swings are accurately graduated, and swivel by means of an arc worm at the top. The bars are massive steel forgings, octagon in form, scraped to a bearing on four sides, allowing for taking up wear in all directions. The bars have continuous caps and a binder bolt is provided in the bottom of bar cap for locking the bar when saddle is feeding.

The feeds, eight in number, are positive, continuous and reversible, and independent for each head, both in amount and direction for down, cross and angular feeding. The tool holders are steel forgings, with provision for readily clamping tools for boring, turning and facing operations. They have straight shanks and are readily removable for the insertion of special boring bars.

Counterweights for each bar are attached to the same chain, but act independently, and will neither pull the swings over, nor interfere with the movement of the saddles. Counterweight chain is placed at the rear of the bars to prevent interference from overhead cranes when handling work on and off the table. Safety friction clutches located on the vertical spline shafts insure against accidents, in case heads or bars meet with obstruction when either feeding or fast traversing. All gears are guarded.

The different materials have been selected to give the best conditions for strength, rigidity and wear. All shafts are of high-grade steel, and the drive is bushed throughout with bronze. Taper gibs are used to take up wear on sliding surfaces. All driving, feeding, fast traversing and elevating gears are of very liberal diameters, pitches and faces; and steel, bronze, raw-hide and semi-steel are used with discretion to give the best conditions of strength, and at the same time, long wear.

The drive is by a direct-current motor of 4 to 1 speed variation, carried on a drive plate in the rear between the housings. Power is transmitted through a double run of clutch gears, giving two mechanical changes in speed, which, with the usual 16 or more speeds in the controller, gives 32 or more speeds to the table. Motor is fitted with push-button control and a dynamic brake for table. A separate motor, located on the top brace of the mill is furnished for elevating the cross-rail and providing rapid power traverse to bars and saddles.

Belt drive through a single pulley or alternating current motor drive by constant speed motor is through a speed

box and back gear located in the rear of the mill, giving twelve changes of speed. All gears in speed box are of Cycloid gear steel, of approximately 200,000 pounds tensile strength, treated and hardened. Speed box is fitted with a hand-operated friction clutch for starting and stopping the table. A brake is provided, and is controlled by the same hand lever at the right hand side of the mill which operates the clutch.

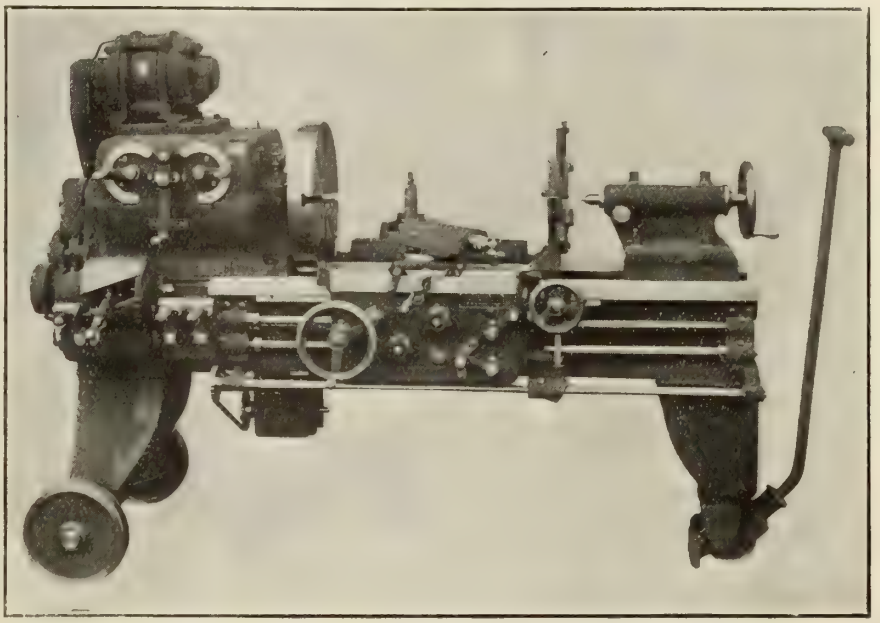
A separate motor, located on top brace of the mill, is furnished with a.c. drive for adjusting cross-rail, and providing rapid power traverse to bars and saddles. Belt-driven machines are built on the convertible plan, and may be readily changed to motor drive.

Boring mills of this design are built in 44 in., 53 in., 62 in. and 73 in. sizes by the Niles-Bement-Pond Co., 111 Broadway, N.Y., and the particular machine here described was supplied by them to the Troy Engine & Machine Co., Troy, Pa.

## BALL-BEARING POLISHING AND GRINDING MACHINES

THE description and illustrations refer to two recent products of the F. E. Wells & Son Co., Greenfield, Mass., being known respectively as their No. 10 Ball-bearing Polishing Machine and their No. 11 Ball-bearing Grinder. The polishing machines are arranged to be driven from the shaft attached to the ceiling of the room beneath, or if the building is only one storey, then the shaft can be run in a trench with the shaft bearings upheld by floor stands. The idler pulley for tightening the belt is located inside the base and is raised or lowered by means of the handle on the outside of the latter.

When starting up, the pulling up of handle forces the idler pulley against the belt, thus taking up all slack, and when it is required to stop the machine, the controller handle is simply lowered. The ball bearings are specially enclosed and completely protected from dust. The diameter of spindle in bearings is 1.7725 inches, diameter of arbor $1\frac{1}{4}$ in., diameter of wheel flanges 5 in., height of spindle from floor 36 in., size of base 17 x 22 in., net weight 510 pounds.



16 INCH HIGH DUTY RAILROAD SHOP PORTABLE LATHE.

The No. 11, or grinding machine, is similar to the No. 10 polisher, except that an overhead drive is arranged.

## RAILROAD SHOP PORTABLE LATHE.

THE accompanying illustration shows a portable lathe, recently built by the American Tool Works Co., Cincinnati, Ohio, for a large railroad shop. It is intended for use in the latter, also in large ma-

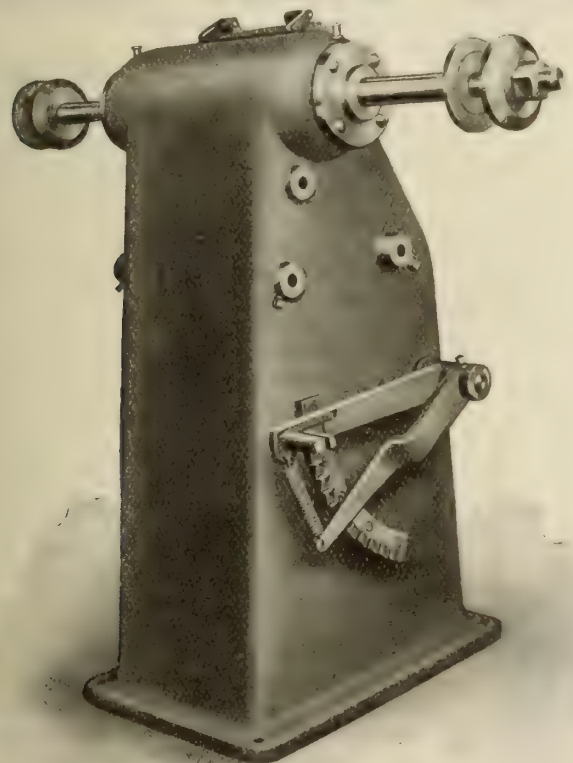


FIG. 1. BALL-BEARING POLISHING MACHINE.

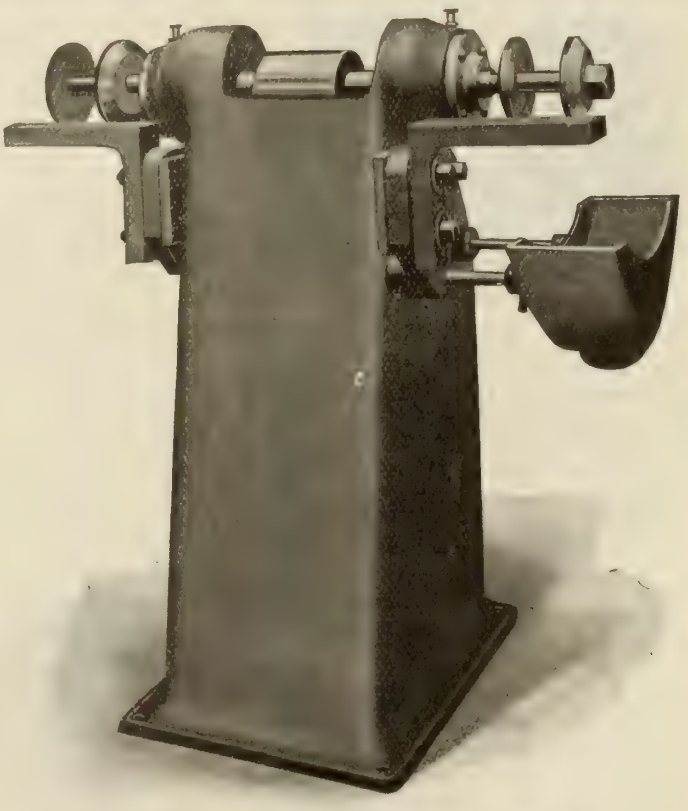

FIG. 2. GRINDING MACHINE WITH BALL BEARINGS.

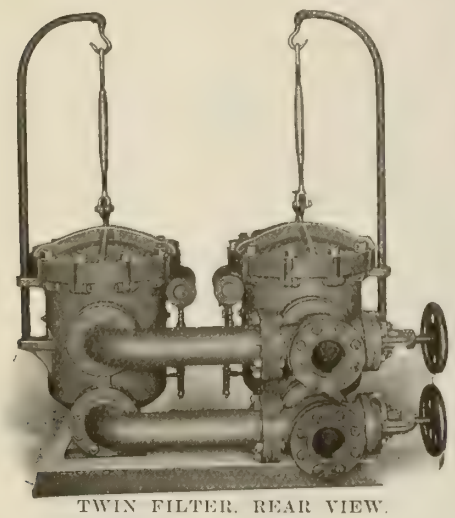
chine shops where it is more economical to take the machine to the work instead of vice versa.

The unit consists of the regular 16-in. American high-duty lathe, with patented 8-speed geared head for motor drive, and all standard equipment, such as unlimited quick-change gear mechanism, double plate all steel geared apron, chilled bed, heavy 4-bolt tailstock and bronze bearings throughout; the whole mounted on three wheels and provided with a long lever for hauling about the shop. Being given a 3-point bearing on the floor, the chances of its getting out of alignment are very slight, even where the floor is uneven.

This machine being complete in every respect, is a very handy and useful tool, being ready for service in any part of the shop at a moment's notice.

## THE BLACKBURN-SMITH TWIN FILTER.

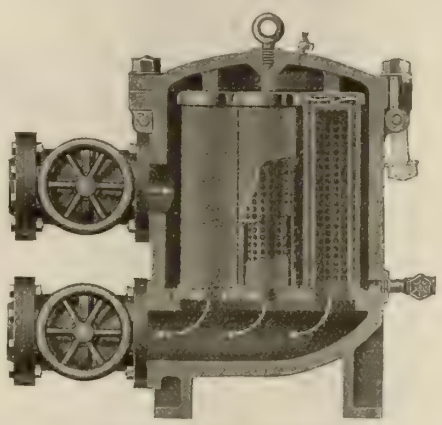
A NEW type of Blackburn-Smith feed water filter and grease extractor, having twin bodies controlled by a single set of inlet and outlet valves, is now being



TWIN FILTER, REAR VIEW.

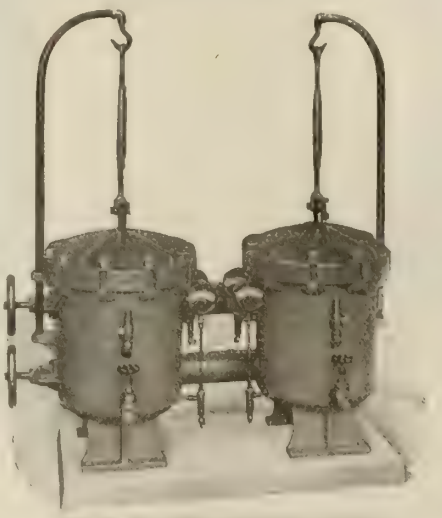
built by James Beggs & Co., of 38 Warren Street, New York, N.Y. The ever-increasing number of plants which carry loads varying greatly at different times, or which operate twenty-four hours per day, has necessitated the design of filters which have considerable flexibility as to capacity, and which permit of the cleaning of one part while the other is in operation. It is readily seen that if a filter of this type is selected of such size that either side alone can carry the regular load, then the two sides can be thrown in during the peak load, thus permitting the thorough filtration of all the water at all times, and without interference by the necessary cleanings. The turning of both valves to one limit by-passes the corresponding body, and the other body is by-passed by turning both valves to the other limit, thus permitting the alternate operation and cleaning of either side. The combined operation of both sides as would be desirable during the peak load is accomplished by turning the valves to mid-position.

The filter is made up of a number of parts, so that breakage or disarrangement of any particular section does not necessitate the discontinuance of all



SECTION OF FILTER.

filter service, and as these machines are tested to 400 lb. hydrostatic test pressure before shipment, the probability of such interruption of service from defective material or workmanship is minimized. The valves are of the double seat type and the disc between is self-seating, thus preventing leakage due to dirt deposited on either disc or seat. The filter chests are the same as in the single type of Blackburn-Smith filter—each divided into an inlet and an outlet chamber by a partition carrying the filtering cartridges. Each cartridge consists of two concentric perforated brass cylinders so covered with linen terry cloth that two uniform separated and successive filtering surfaces are put into the path of all entering water. The opening of the filter for cleaning is facilitated by the use of a large cover held by swing bolts. A crane and turnbuckle lifts, swings and holds the cover during cleaning with a minimum of labor.



TWIN FILTER, FRONT VIEW.

## MARKING A CHEQUE "IN FULL SETTLEMENT."

THE opinion is widely entertained in trade circles that when a cheque is marked "In full settlement" by the drawer it cannot be retained and treated as a payment on account. A case recently tried in the City of London Court serves, says the Draper's Record, as a reminder that this doctrine must not be accepted without qualification. The plaintiff kept the cheque so marked and subsequently sued his debtor for the balance of the account. The court held that he was within his rights in so doing. It is, therefore, clear that the mere endorsement of the cheque is not to be interpreted as meaning that the recipient agrees to the special condition set out on the face of it. At the same time it may be presumptive evidence of an agreed settlement. Each case will have to be determined on the facts.

Probably the most satisfactory course to pursue in such circumstances would be to send the cheque back, declining to accept it in settlement. No misunderstanding could then occur, but, as the judge pointed out, it might result in the creditor being kept out of his money for several months. The subject is not free from difficulty, but commercial sentiment generally would be opposed to accepting a cheque so marked and then repudiating the condition. This, of course, is not to say that circumstances could never justify such conduct.

## DOMINION FISCAL RETURNS.

DURING January the national debt of Canada increased by $18,634,352. It now stands at $395,378,516, an increase of nearly $80,000,000 as compared with January 31 of last year.

The revenue for the last month was $9,897,664, as compared with $11,529,753 in January of last year. For the first ten months of the present fiscal year the revenue has decreased by $30,000,000, as compared with the corresponding fiscal year, the total revenue of the past ten months being $109,533,607. The decrease in customs duties for the month of January was a little over two millions, and for the ten months about twenty-eight millions.

Expenditure for the ordinary cost of administration for the ten months totalled $101,956,366, an increase of about nine millions, as compared with the first ten months of 1913-14. Capital expenditures for the past ten months have totalled $36,753,359, a decrease of approximately ten millions on the corresponding period of last year.

Temporary loans made by the Dominion Government now total $48,799,999, as compared with $18,006,666 a year ago.

## STIMULATING BUSINESS.

IT would be idle to even pretend that business in its every individual as well as collective sense is being nourished and stimulated as it should. For many months now the disposition has been altogether the reverse of this, the gospel of extreme caution and rigid economy being both zealously preached and practised. Throughout the length and breadth of our land the cry has gone forth that we have in the past been altogether too extravagant, by which term we assume that we have been much too prodigal with our own and other people's cash.

Immunity from the sweeping assertion there is none, we are taught to believe, whether in the individual or corporate feature, and the result is that in numerous instances without semblance of reason, we opine that it must be true. In a word, the continual patter—chatter is perhaps more appropriate,—about retrenchment has overwhelmed us, as by an anaesthetic, and reason has given place to imagination. A good many years ago, an article appeared in Chambers's Journal, with the title "Can Imagination Kill?" The writer, without having to theorize much, showed that imagination could and did kill, and we in Canada to-day bear unquestionable testimony to the conclusions then drawn. We have allowed our imagination to practically kill Canadian business enterprise in its every feature.

At this late day there still lingers the idea that certain specific happenings in which the public are involved can be kept private, and that only those who direct the particular transactions therewith connected really count. Intelligence is still reckoned to be at a low ebb among the public generally, and in any case the individual constituents of that public are so engrossed in the affairs of their own little circumscribed world that they are hopelessly blind to what takes place beyond, or even over their shoulder. Canada cannot build submarines and manufacture shells, clothing and other munitions of war for her own or the allies use, without the world knowing it, much less her own citizens knowing it and, without finally, the latter becoming sufficiently interested as to become equally familiar with the multitudinous details and to quite rival in first hand information acquired, those charged with the planning and adminstration of the particular undertaking. In like manner, our railroad and manufacturing corporations cannot start and continue to practise retrenchment necessary or otherwise without our people in their every sphere making mental note of the shortening of sail and proceeding to do likewise.

Manufacturing Canada has impressed unfavorably agricultural Canada, and without justification. The business depression has little, if any, connection with our farming interests, yet the latter intuitively have proceeded to conserve their resources and quite unwarrantably so just, by reason of the propaganda of the manufacturer and financier having been so bountifully broadcast.

There is far too much disposition on the part of our business interests to anticipate and to make themselves believe that still harder times are in store for us, and too little realization that what lies in the near future will be just what we choose to make it. The efforts of the past six months have been solely directed to conservation with the result that so far as our industries are concerned we are in about as bad a plight—barring annihilation as any coming months can make us.

The gospel of efficiency made many converts in the past few years, and had many exponents, but to-day when the real need for its application and propagation exists as never before, the preachers are silent and the subject ignored. The economy being practised within our borders at this time does not necessarily arise from or contribute to any standard of efficiency, rather is the widespread continuance of the trade depression attributable to the lack on the part of each individual concern and the units composing it of maintaining, when business suffers a jolt, the standard set in prosperous times.

It is not enough to believe that the Allies are going to win out, they must employ the means to that end; likewise, while we believe that business will come all right in Canada in time, it is equally incumbent that we as individuals apply ourselves to that end. The worst is past if we will only be optimistic enough to believe it and put our convictions into practice.

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

**Montreal, Que., Feb. 8, 1915.**—Industrial conditions remain very much the same as those prevailing during the last few weeks. The outlook is, if anything, rather brighter. It is hard to separate business from the events of the war, and the developments of the last few days relative to shipping have served to give more emphasis to the fact.

The steel business continues to be fairly active in merchant bars, but building sections are not in much demand. Machine tools are still in a rather novel position, the demand being large along certain lines and practically nil in others. The foundry department is still much as it has been since the outbreak of the war, little change being apparent either way. Recent events on the high seas seems to have had a more or less direct effect on metals. These, being largely required by the belligerent powers, are in great demand, and their production, sale and shipment of the various metals are, therefore, surrounded by interesting circumstances.

#### The Steel Market.

The steel trade, in as far as supplies for munitions of war are concerned, is good. Merchant bars are in good demand also. The railroads are only placing nominal orders, although it was anticipated that these corporations would be buying more extensively at this time. Some small orders for marine castings and forgings have been placed. Inquiries of a general nature are coming in

very freely, but not a great deal of business is being placed; however, it is confidently expected that encouraging developments will take place in the next few weeks.

**Pig Iron.**

The general slackness in the pig iron market still continues. Foundries operating are doing so greatly under capacity, and business passing is only for small lots. Prices continue to remain at very low figures. Orders taken for delivery in the second quarter are common, as a consequence an increase in price is not anticipated.

**Machine Tools.**

It is a difficult matter to purchase certain tools which are used in the manufacture of shrapnel shells at the present time. The placing of further orders for shells in Canada has created a demand for turret lathes and grinders in excess of the supply at hand. In other lines there is little business moving. In short, the machine shops of Canada have been largely turned into factories producing ammunition. Thus the demand for tools is almost confined to those required in this line of manufacturing. The demand for supplies is improving as the war orders increase. Prices, however, remain unchanged except in a few instances.

**Metals.**

The metal market again has been the scene of more or less interesting manipulation. Copper seems to have been the centre about which most of the interest has collected. A huge amount of this metal is being shipped to Europe, largely for the use of the allies. Although the price of tin has not advanced during the week, the tone remains strong and an advance may be anticipated. Spelter has gone up one cent per pound, and the supply is apparently being cornered. There ought to be sufficient spelter produced to supply all demands, and it is rather hard to understand why the price should be so stiff. Lead, tin, and antimony have all been rather quiet, and no change in prices have been reported.

---

**Toronto, Ont., Feb. 9, 1915.**—There is little change in the industrial situation to note this week, although the outlook is gradually brightening. Factories engaged on Government contracts are very busy. Large orders are being distributed, and these are tending to develop business along lines approaching to normal. The increase in production will materially benefit a large number of people and put a considerable amount of money in circulation. The export trade of the Dominion is expanding, although the volume of imported goods has declined, not altogether an unfavorable feature, except for the resultant loss in revenue, which for the year 1914 reached the total of $18,000,000. The budget speech, which will be delivered on Thursday, is being awaited with interest in business circles, and there is a considerable amount of conjecture as to the exact policy the Government will adopt. It is generally thought, however, that a general war tax will be announced.

The iron and steel market remains dull, and prices on bars, plates and shapes are weaker. The scrap metal market is dull and getting weaker, although prices are unchanged. The pig iron market is stagnant and prices are unchanged. The demand for machine tools for making shells continues and the number of plants engaged in this business is increasing. Supplies are slow, with no change in prices. The metal markets are strong, copper, tin, spelter, lead and antimony all having advanced, due to conditions in the primary markets.

**Steel Trade.**

The steel market is still in the same dull condition as during the past few weeks, and the outlook for any immediate improvement is not particularly bright. Prices on Pittsburg bars, plates and shapes for local consumers are weaker, which may stimulate business; $1.10 f.o.b. Pittsburg is now being quoted. The contract for the Rosedale section of the Bloor Street viaduct has been awarded to the Dominion Bridge Co. This will be built of steel, and will cost $298,555.

The steel market in the States is looking better this week, and prices on bars, plates and shapes have an upward trend. The number of furnaces in blast is gradually increasing, and a further increase in output is looked for. Galvanized sheets have advanced on account of the high price of spelter.

**Pig Iron.**

The pig iron market is uninteresting, and comparatively little iron is moving. The situation in Buffalo is improving, and prices are firmer.

**Machine Tools.**

There has been rather less activity in machine tool circles this week. The business being booked is almost entirely for machine tools, grinders, etc., for shell manufacture. The number of plants engaged in this business is increasing, and local dealers are busy figuring on suitable equipments. A number of nice orders for tools have been booked by local machinery houses recently.

**Supplies.**

There is a fair demand for machine shop supplies, but orders for the most part are for small lots. There has been no change in prices during the week, although it is expected that linseed oil will go higher in the near future.

**Metals.**

Notwithstanding the comparatively light demand locally for most metals, the markets for the most part continue to advance. This is accounted for by the strength of the primary markets, which are subject to different conditions from what obtain here. Tin is strong, and has advanced 1½c, being now quoted at 39c per pound. The strength of the tin market is accounted for by the congestion in the port of London. The copper market is firm, and prices are higher at 15¼c per pound for lake. The spelter market is higher on account of heavy demand from Europe and from the brass mills, which are busy on war materials. Spelter has advanced 1c, and is now quoted at 8½c per pound. Lead is firm at 5¼c per pound, being ¼c higher. The antimony market has advanced 1c, and is firm at 19c per pound. Aluminum is unchanged at 22c per pound. Solders have advanced in sympathy with the tin market.

---

**St. John, N.B., Feb. 6, 1915.**—Conditions in general manufacturing and machinery business throughout New Brunswick continue to be quite encouraging, and proprietors of local houses are making no complaint as regards their share. In some lines there has been increased activity since the war, owing to participation in army contracts, and this has reflected upon business in other branches of industry. Prospects are bright for a good season in lumbering, provided weather conditions and supplies of snow are favorable, and since the lumber trade influences various other lines of business in New Brunswick, generally speaking, other commercial interests are well sustained, if it be prosperous. Shipments through St. John to the Old Country are considerable, and maritime business has kept up quite steadily. In some of the smaller towns, of course, there has been a slow period, but on the whole conditions are very satisfactory and, compared with reports received and statistics from other centres, are to be regarded as highly encouraging to the manufacturers throughout the province.

**Army Contracts.**

The matter of the manufacture of shells for use of the allies has engaged the attention of local iron manufacturers, and an interesting announcement in this connection is that the Messrs. Fleming, of the Phoenix Foundry, are vigorously proceeding with the changes and additions to their plant necessary to enable them to handle a big contract for shrapnel shells received from the War Office. Special equipment

is necessary and its installation is now in progress. The work will be prosecuted by night and day shifts.

H. Horton & Son, leather manufacturers, received an order for 600 sets of saddlery for the Russian Government, the total cost of which will be about $43,000, with delivery guaranteed for March 31. Their factory is being run night and day in the performance of the contract. Other firms have been favored with war contracts also.

The new sugar refinery in St. John, owned by the Atlantic Sugar Refineries, Ltd., one of the finest and most up-to-date in Canada, is about completed, and operation will start in a few days. The machinery in the new building, which is several storeys in height, and located on the water front, has been running on test for some weeks, and has proven entirely satisfactory.

Persons interested are fully expecting that the Hewson Pure Wool Textiles, Ltd., of Amherst, N.S., will resume operations in the near future. At a recent meeting of a joint committee of the Amherst Town Council and Board of Trade with the directors of the company, a plan was agreed upon which is expected to result in the resuming of work by this big house with their splendid factory. Recommendations have been made that the bondholders buy up the company, and a meeting of these latter is to be held on February 11 to decide upon this. That $150,000 new capital be raised for working purposes was urged, and promises of Government contracts in connection with the supply of war woolens were intimated.

A real estate deal of large proportions has been effected in St. John whereby the big lumber interests and harbor rights of Hilyard Bros., in Strait Shore, have passed to J. S. Gregory. This includes a big lumber plant, wharves, docks, and other essentials, and is one of the most important real estate transactions of recent date locally.

### New Brunswick's Chance.

While in the city recently, H. P. Timmerman, Industrial Commissioner for the C. P. R., speaking to a representative of "Canadian Machinery," dwelt in an interesting way upon the opportunities of New Brunswick industrial enterprises to enter new markets and to share in the trade lost by Germany and Austria owing to their sea outlets being closed. Raw material and its production were the keynotes to this question, Mr. Timmerman said, and the attention of manufacturers not only in New Brunswick, but all through Canada, should be directed to the sources of supply near at hand. The "Made-in-Canada" campaign had been productive of splendid results, and he thought it should be encouraged and enlarged.

Speaking of the lumber trade, he referred to the fact that in Ontario last year woodworking factories had imported $5,000,000 worth of hardwood, the greater part of which it would have been possible to secure in Canada, much of it in New Brunswick. The operators in this province, he thought, should seek Ontario as a market for birch in particular, and he believed quite a trade could be established.

# Canadian Commercial Intelligence Service

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

## Engineering

**Renfrew, Ont.**—Thomas Pink & Co. have secured a contract for the manufacture of shells.

**Essex, Ont.**—The Town Council is considering the purchase of a steam pump and boiler.

**Barrie, Ont.**—Fire at the Barrie Foundry Co. of Jan. 21 caused damage to the extent of $1,300.

**Hamilton, Ont.**—Machinery will be purchased by A. Anderson, care of Procter Gamble Co., Ivorydale, Ohio, for the new $1,000,000 soap factory the company is erecting at Hamilton, Ont.

**The Montreal Locomotive Co.** has booked an order for shrapnel shells and has already purchased hydraulic projectile presses. Other equipment will be purchased.

**Jas. Steele, Ltd.**, of Guelph, Ont., makers of wire springs, have recently installed automatic machinery for making upholstering springs for the automobile and furniture trade.

**The Canadian Fairbanks-Morse Co.**, Toronto, have sold a number of tools to the Dominion Chain Co., Niagara Falls, Ont., including Brown & Sharpe, millers and surface grinders, radial drills, lathes, grinders, etc.

**Lindsay, Ont.**—At a special meeting of the town council held on Feb. 4, a proposition to guarantee the bonds of the Boving Co., of Canada, for $30,000 was introduced. A by-law will be submitted to the ratepayers authorizing the guarantee.

**Shrapnel Shell Order.**—The Collingwood Shipbuilding Co. have received their first order of shrapnel shells from the Canadian Government, and although the quantity is not named we understand it to be large and the forerunner of further orders. Production will be started immediately, the necessary machinery purchased has been installed.

**New Westminster, B.C.**—The building and plant of the Westminster Wire and Nail Works, on Lulu Island, have been acquired by G. W. Laidlaw, of Vancouver. Mr. Laidlaw has already started to transfer his Vancouver plant to the new location, where operations will be started immediately. He specializes in crosshead bale wire for baling hay and in barrel hoops, and the plant will also turn out staples.

**Canadian Copper Co.**—It was officially announced by the Canadian Copper Co. that mining operations are to be resumed at No. 2 and Crean Hill mines, and the two idle furnaces at the smelter at Copper Cliff are to be started up forthwith. No. 3 mine will not be started, neither will the reverberatory furnaces. In a very short time, therefore, the mining and smelting operations of the company will have returned to normal output, as existed previous to the outbreak of war last August.

**John S. Metcalf Co., Ltd.**, of Montreal, is designing two elevators for the Arthur Guinness Son & Co., the famous Dublin brewers. The two elevators are for their new plant at Manchester, England. One of them will have a capacity of 835,000 bushels, and will receive, store and clean barley. The second elevator will have a capacity of 600,000 bushels, and will be used exclusively for malt. There will be in addition facilities for handling both sack and bulk grain from boats and from cars. Both structures will be of concrete. The cost of the work is approximately $600,000.

## Municipal

**Vernon, B.C.**—The council contemplate extensions to the sewage disposal plant.

**Regina, Sask.**—The Commissioner recommended that the contract for valves be given to J. H. Ashdown Hardware Co.

**Alexandria, Ont.**—Extensions are contemplated to the waterworks system and electric lighting plant at an estimated cost of $5,000.

**Wallaceburg, Ont.**—The town has taken over the electric light plant hitherto owned by a private company. The purchase price was $36,976.

**Winnipeg, Man.**—Mayor Waugh has stated that the city will spend $3,000,000 this year on the Greater Winnipeg aqueduct and other necessary works.

**Port Alberni, B.C.**—The council will purchase from Waterhouse & Greene, of this city, 1,900 feet of 6-in. and 450 feet of 8-in. sewer pipe. Total cost, $500.

**Brockville, Ont.**—A 4,000,000 gallon filtration plant will probably be installed. F. A. Dallyn, Provincial Sanitary Engineer, has reported in favor of filtering the water supply.

**Orillia, Ont.**—The council, at its meeting on Feb. 1, approved of the principle of paying a commission to a publicity agent who is locating English and American industries in Canada. The commission will be based on the amount of wages paid by such new industry as may be located by him in Orillia.

**Ottawa, Ont.**—J. B. McRae, consulting engineer, to whom has been entrusted the work of preparing plans for the Lemieux Island overland pipe for submission to the Provincial Board of Health, visited Toronto recently to submit plans to the Board.

**Brockville, Ont.**—On February 2, at a joint meeting of the Council, the Board of Health and the Water Commission, action was taken to extend the intake pipe, to consider the cost of a filtration plant, and to arrange for changing the discharge of the sewer west of the town into the main sewer instead of the river.

**St. Thomas, Ont.**—The City Council is again moving toward securing natural gas. A special committee was named at their meeting on February 3 to prepare a statement of what the charges would be if the city used natural gas, and to obtain any other information they deem necessary, and to report to the chairman of the finance committee as soon as possible.

**Toronto, Ont.**—Four sections of the North Toronto waterworks system will be done by contractors. Commissioner Harris' figures were considerably in excess of contractors' figures, and contracts were awarded as follows:—W. H. Murphy, $16,147.50; J. A. Maguire, $16,882.50; J. H. McKnight, $17,790, and J. H. McKnight, $8,345.50. Labor will, to some extent, be drawn from the civic employment bureau.

**Ottawa, Ont.**—It is said that the Dominion Cabinet have been watching closely the proceedings of the city council regarding the water question in Ottawa, and that the matter will receive some consideration during the forthcoming session. It has been stated that the offer of the Government towards a scheme for bringing mountain water into the city is $100,000 per annum, but that this may be increased to $150,000.

**Toronto, Ont.**—The Commissioner of Works has recommended that the con-

tract for the construction of the Rosedale section of the Bloor Street viaduct be awarded to the Dominion Bridge Co., and the recommendation has been sent on by the Board of Control. The Dominion Bridge Co. tender was $312,458 for the section complete, or $298,555 for the section minus the lower deck. Commissioner Harris selected the latter tender.

## General Industrial

**Windsor, Ont.**—A factory is being erected by the Windsor Mfg. Co.

**Quebec, Que.**—The Touriguy & Marois Co. expect to begin operations at their new shoe factory early in March.

**Woodstock, Ont.**—The creamery established at Beachville by the Wm. Neilson Co. of Toronto was opened on Jan. 25.

**Montreal, Que.**—The Maple Leaf Shoe Co. factory was destroyed by fire on February 3. The damage is estimated at $15,000.

**Cranbrook, Alta.**—Harry C. Moore of Blairmore, Alta., is interested in a company who propose to establish a wood distillation plant here.

**London, Ont.**—It is stated that James Playfair, of the Canadian Navigation Co., plans to build a grain elevator at Port Stanley at a cost of $100,000.

**Maisonneuve, Que.**—The Montreal Toy and Novelty Co. is asking for exemption from taxation on a factory which they will erect here for the manufacture of toys.

**Lethbridge, Alta.**—A Magrath report states that the Ellison Milling Co. are considering erecting a new elevator there to replace that destroyed by fire over a year ago.

**London, Ont.**—Gordon Philip, Industrial Commissioner, has announcel that negotiations have been completed for the establishment of two new industries by the spring.

**Guelph, Ont.**—An important industry which will employ quite a number of hands is in communication with the civic authorities, who are doing all in their power to induce them to locate here.

**Carlstadt, Alta.**—Fire destroyed the West Grain Co. elevator here on Jan. 24. The elevator had five thousand bushels in it at the time and the total loss is about $20,000, partly covercred by insurance.

**Fort William, Ont.**—It is reported that Barnet & McQueen have been awarded the contract for the new addition to the Ogilvie Flour Co.'s elevator here. The capacity of the elevator will be increased by 750,000 bushels.

**Toronto, Ont.**—The Rudd Paper Box Co. have applied for a permit to rebuild that section of their factory recently destroyed by fire. The cost will be $30,000. The company hope to have their 175 employees back to work in six weeks.

**Guelph, Ont.**—Messrs. Alex. Simmers and W. Shiply, Canadian manager of the New Idea Spreader Co., whose headquarters are at Coldwater, Ohio, have been in Guelph looking over the ground in connection with the proposed Canadian factory.

**Quebec, Que.**—Legislation will shortly be introduced in the Provincial Parliament to provide for another $10,000,000 for the good roads programme of the Province. This loan of $10,000,000 will likewise be available for completing the national highways from Montreal to Quebec for which the Government assumes the entire cost.

**ALLIES PURCHASING AGENTS.**

**The Trade and Commerce Department, Ottawa, has published the following list of purchasing agents for military purposes for the allied Governments:—**

**British—Col. A. G. Barton and Mr. F. W. Stobart, Ritz Carlton Hotel, Montreal.**

**French—Hudson Bay Co., 56 McGill Street, Montreal; Captain Lafoulloux, Hotel Brevort, New York; Direction de l'Intendance Ministere de la Guerre, Bordeaux, France; M. De la Chaume, 28 Broadway, Westminster, London.**

**Russian — Messrs. S. Ruperti and Aiekieff, care Military Attache, Russian Embassy, Washington, D.C.**

**Toronto, Ont.**—The five-storey building of the Rudd Paper Box Co., 372 to 376 Richmond street west, was gutted by fire, which broke out shortly after one o'clock on Jan. 27. The building was valued at $65,000, the contents $35,000, and the plant and equipment $75,000, a total of $175,000. The insurance will amount to $108,000.

**Walkerton, Ont.**—At a joint meeting of the Board of Trade and the Town Council on February 1, with a view to taking steps to secure contracts for war materials, offers were read from the Walkerton Electric Light Co. and R. Truax & Son, offering free power for any factory securing such contract and manufacturing in Walkerton during the war.

**MacLeod, Alta.**—The MacLeod Flouring Mills, Ltd., whose elevator was destroyed by fire a few weeks ago, has leased the Alberta Co-operative elevator at this place and will carry on their business as usual. In the meantime they are making preparations to rebuild and expect to have their own elevator completed before next season's crop is harvested. A. J. Maley is manager.

**Toronto, Ont.**—The report of the Ontario Highways Commission that the Ontario Government spend $30,000,000 on good roads throughout the province will not be adopted by the Government. The cabinet has decided not to introduce any bill asking for permission to borrow $30,000,000 for road purposes. Good roads legislation is still under consideration, but the measure to be brought down will not cover more than a few million dollars .

**Owen Sound, Ont.**—As soon as the weather will permit, the McQuay Tanning Co. intends to build a large addition to its plant, in order to accommodate its increasing business. The additions will include a leach house 35 by 110 feet, and a new vat house 30 by 40 feet, and three storeys high. Improvements will also be made to the boiler and power plant. The changes will involve an expenditure of about $15,000.

**Vancouver, B.C.**—It is stated that Lever Brothers have purchased a 21-years' lease of land on Burrard Inlet, with an option of renewing the lease for another 21 years, and that they were ready to spend over $200,000 there at once on factory, buildings and machinery; but the Harbor Board will not give Lever Brothers a waterfront lease for a longer period than five years, which the firm did not consider was long enough to warrant the expenditure proposed. The project is, therefore, being held up.

**Regina, Sask.**—A company of Regina business men has been organized for the purpose of developing the extensive fields of lignite coal in the southern part of Saskatchewan. The Government of the province has been carrying on experimental work in connection with the lignite coal for some months past, and it is as a result of these tests that the Regina company has been organized. The reports previously submitted dealing with the quantities of lignite coal in the southern part of Saskatchewan show that there is practically no limit to the supply. A method of briquetting the lignite coal has been devised and it is claimed that this will result in a saving in fuel of from 40 to 50 per cent.

# Tenders

**Port Alberni, B.C.**—Tenders will be called for the supply of a quantity of 10-in. and 12-in. steel pipe, also wooden staves for the 16-in. water main.

**Toronto, Ont.**—Tenders will be received by the chairman of the Board of Control, City Hall, up to Tuesday, April 13, 1915, for the supply of automatic valves and check valves. Specifications and tender form for the foregoing may be obtained upon application at Room 12, Purchasing and Accounting Section, of the Department of Works, City Hall, Toronto.

**Toronto, Ont.**—Tenders will be received by the chairman of the Board of Control, City Hall, up to Tuesday, Feb. 16th, 1915, for the construction and delivery of 24-in., 30-in. and 36-in. cast iron special castings. Specifications and tender forms for the foregoing may be obtained upon application at the office of the Water Main Extension Section, Department of Works, Room No. 9, City Hall.

**Toronto, Ont.**—Tenders will be received, addressed to the chairman of the Board of Control, City Hall, up to Tuesday, March 2nd, 1915, for the construction and delivery of 24-in., 30-in. and 36-in. stop valves, and one 36-in. check valve. Specifications and tender forms may be obtained upon application at the office of the Water Main Extension Section, Department of Works, Room No. 9, City Hall.

**Ottawa, Ont.**—Tenders will be received until Monday, March 1st, 1915, for the supply of brooms and brushes, chain, hardware, hose, oils and greases, packing, paint, paint oils, etc.; Manila rope, wire rope, and steam pipe, valves and fittings, for the departmental dredging plant in Ontario and Quebec. Combined specification and form of tender can be obtained at the Department of Public Works. R. C. Desrochers, secretary.

**Ottawa, Ont.**—Tenders will be received by the Secretary of the Waterworks committee up to Tuesday, February 23, 1915, for the supply and delivery of brasswork, special pipe castings, cast iron pipe, lead pipe and pig lead, valves, oils and greases as the case may be. Specifications, form of tender and full particulars may be obtained on application at the City Engineer's Office, City Hall, Ottawa. R. L. Haycock, Acting Waterworks Engineer.

**Saanich, B.C.**—Tenders will be received by the undersigned at the Municipal Hall, Royal Oak, Saanich, B.C., up to March 12, for the supply of materials, including cast iron pipes and special castings, valves and hydrants. Specifications, schedules of quantities and particulars may be obtained from the municipal engineer's office, upon making a deposit of $25, which will be returned on receipt of bona fide tenders. Hector S. Cowper, clerk, Municipal Council.

**Ottawa, Ont.**—Tenders will be received at this office until Wednesday, Feb. 24, 1915, for the installation of one (1) standard passenger and two (2) standard freight elevators in the examinging warehouse, Port Arthur, Ont. Plans, specification and form of contract can be seen and forms of tender obtained on application at the offices of Thos. A. Hastings, Clerk of Works, Postal Station "F," Toronto, Ont, from William Hood, architect, Port Arthur, Ont., and R. C. Desrochers, Department of Public Works, Ottawa.

**Ottawa, Ont.**—Tenders will be received up to February the 26th for 1,000 sets of the undermentioned accoutrements, half quantity for delivery to H.M.C. Dock Yard, Halifax, and half to H.M.C. Dock Yard, Esquimalt, B.C.: Belts, waist (leather); bags, ammunition (leather); bandoliers (leather), braces (leather), water bottle slings (leather); holsters, pistol (leather); pouches, cartridge pistol (leather); mess tins and covers, canvas; haversack, canvas; water bottle, enamelware (with felt cover). Patterns may be seen, and tender forms with full information may be obtained on application to the undersigned and to the Naval Store Officers, H. M. C. Dockyards, Halifax, N.S., and Esquimalt, B.C. G. J. Desbarats, Deputy Minister of the Naval Service, Department of the Naval Service, Ottawa .

# Trade Gossip

**The John S. Metcalf Co.**, of Montreal, is now completing elevator No. 2, for the Manchester Ship Canal Co., at a cost of $900,000.

**Warren, Ont.**—A local chemical manufacturing concern has started work on a large order of guncotton for the British Government.

**Saskatoon, Sask.**—G. Field and Harry Wells have established a plant in the McEown Building, under the name of the Western Tent and Mattress Co., for manufacturing tents, awnings, etc.

**Toronto, Ont.** — The York County Council are considering the purchase of a supply of rifles of an approved type for the use of the members of the different Home Guard organizations throughout the country.

**New Glasgow, N.S.**—At a meeting of the board of directors of the Nova Scotia Steel and Coal Co. it was decided to restore to the men the 25 per cent. wage cut which they received in July last at the outbreak of the war.

**U. S. Copper Shipments.**—Copper exports from the United States amounted to 15,389,322 pounds, valued at $2,067,356 during the week ended January 30. Of this 6,289,648 pounds went to France, 4,776,728 to England, 1,717,428 to Italy, 1,456,336 to Sweden and 691,142 to Canada.

**Port Alberni, B.C.**—Officers for the year were elected by the Board of Trade as follows:—President, A. Sproat (re-elected); vice-president, S. G. Roseborough; secretary, W. S. Barton; treasurer, T. W. Trew; executive council, E. S. V. McClintock, W. A. Stevens, I. C. Lewis, C. A. McNaughton, F. W. Doherty.

**Arnprior, Ont.**—A new industry has been organized here recently under the name of the Arnprior Manufacturing Co. They will manufacture jersey and canvas gloves and mittens. The officers of the company are:—President, A. Stevenson; vice-president, J. S. Phillips; secretary-treasurer, C. E. Bremner; manager, A. Bremner.

**Oshawa, Ont.**—The Board of Trade met on Feb. 2 and elected the following officers for the ensuing year: Col. J. F. Grierson, pres.; J. W. Provan, vice-pres.; D. A. J. Swanson, sec'y-treas.; Board of Trade council, the above officers and Messrs. H. B. Samuels, Jno. Stacey, W. L. Law, T. B. Mitchell, J. P. Hennessy, J. F. Tamblyn, A. S. McLeese.

**Red Deer, Alta.**—At a meeting of the Board of Trade held recently, the following officers were elected:—President, R. B. Welliver; vice-president, T. A. Gaetz; council, Dr. Collison, W. E. Lord, S .N. Carscallen, John Malcolm, H. H. Gaetz, John McLennan, F. W. Galbraith, G. W. Smith, H. H. Humber, Harry Wallace.

**Kenora, Ont.**—The annual general meeting of the Board of Trade was held here last week. The election of officers for the present year resulted as fallows: President, Major Schnarr; vice-president, M. K. Heap; secretary-treasurer, R. J. Moore; council of the board, J. P. Earngey, W. G. Cameron, George Drewry, J. T. Brett, D. McLeod, A. Shragge, Thos. Walsh and Geo. A. Beatty.

**Collingwood, Ont.**—At the annual meeting of the Board of Trade, held on February 1, officers were elected as follows:—President, D. L. Darroch; vice-president, J. F. Zimmerman; secretary, C. L. Stephens; treasurer, David Wil-

liams; councillors, J. M. Smith, F. W. Bryan, W. A. Hogg, F. F. Telfer, G. C. Begg, W. R. Patterson, M. P. Byrnes, W. A. Copeland, H. A. Currie, F. A. Hodgson.

**Owen Sound, Ont.**—The following officers have been elected by the Board of Trade:—J. K. McLauchlin, president; Elias Lemon, vice-president; and George Menzies, secretary. The members of the council of the board are: John Parker, W. R. Chester, William Taylor, J. M. Kilbourn, F. W. Harrison, C. A. Fleming, W. H. Smith, T. W. Douglas, J. R. Wainwright, L. L. Dales. E. W. Harrison was elected the representative of the board in the municipal council for 1915.

**Ottawa, Ont.**—A delegation from Southern Alberta met the Government on Feb. 1 and asked that five million dollars be spent in continuing public works and irrigation schemes in that Province, especially in the Lethbridge district. The particular object is that of relieving the problems of unemployment. The delegation, which comprised the mayors of Calgary, Lethbridge, and Medicine Hat, got an assurance of consideration of their proposals.

**Exports Prohibited.**—An Order-in-Council has been passed at Ottawa prohibiting the export of tinned meats and tinned plates to Sweden, Denmark and the Netherlands. An embargo has been placed also upon the export of tea, clover, grass seeds and motor vehicles to all foreign ports in Europe, and to Mediteranean and Black Sea ports, except France, Russia, Belgium, Spain and Portugal. Aniline oil and salt and certain acids used in tanning, explosives of all kinds, ships, floating docks, whale oils must not be exported to any but British countries.

**National Clay Products Association.**—The annual convention of the Canadian National Clay Products Association was held recently in the King Edward Hotel, Toronto. Almost 100 delegates were in attendance from various parts of the Dominion, while a number of prominent clay manufacturers from the United States were also present. The association was officially welcomed on behalf of the city by Mayor Russell, M.P.P. President Charles A. Millar, in opening the convention, spoke in an optimistic tone.

**Toronto, Ont.**—The Toronto Board of Harbor Commissioners, during the last six weeks, has received twelve applications from United States firms in regard to the new water front area. Previous to the period from August on to December there was a complete cessation of interest in the new industrial area under creation and the recent activity in the industrial field. The area for industries in the Ashbridge Bay district is assuming shape and the commission is in a position to deal with all applications. About a thousand men will be given employment when the harbor development work is resumed next April.

**Big Orders for Lumber.**—The latest section of Canadian business to benefit by the purchase of supplies for the British Government is the lumber trade. Frederick Stobart, British War Office representative, states resently that he has placed large orders with British Columbia firms for lumber to be used in the form of railroad ties and bridge timbers. The purchase of this material would appear to justify the belief that the British Government is planning to construct certain military railway lines, and, if this is so, it is not unlikely that other manufacturers of construction materials, as well as manufacturers of rolling stock and locomotives, may receive some orders from the same source.

**U. S. Exports of Copper.**—Copper exports from the United States for the week ended January 23 amounted to $3,050,601, or $2,011,580 more than was shown for the preceding week, ended January 16, according to reports from the ten principal Customs districts by the Department of Commerce. The total export last week was 23,057,055 pounds, against 7,836,759 the preceding week. France was the principal purchaser of copper from United States markets last week, 14,927,323 pounds being transported there. Italy was second with 4,114,324 pounds and England was third with 3,489,437. During the eight weeks ended January 23, 93,396,426 pounds of copper, worth $12,001,006, were exported.

**Toronto, Ont.**—This city's share in Federal appropriations, announced at Ottawa last Monday night, includes in the new votes $1,000,000 for harbor improvements, $15,000 for the fish exhibit at the Canadian National Exposition, and $12,000 additional for the Dominion buildings, for which $225,000 is revoted. Other revotes are $213,000 for military buildings, and $74,000 for Spadina Avenue postal station.

**C. M. C. New Financing.**—The Canada Machinery Corporation, Ltd., has called a meeting for February 18 in Galt, at which the first mortgage bondholders will receive a new proposition regarding their holdings, upon which a full year's interest of 6 per cent. is now in arrears. It is proposed to pay the past due interest, and also the accruing interest for 1915 and 1916, by issuing second preferred stock, ranking subsequent to the first preferred stock issue. The bondholders will also be asked to exchange one-half their holding of bonds for first preferred stock, ranking with the present issue outstanding, and to consent to the placing of a prior lien mortgage on the company's properties in Hamilton, the proceeds to be applied toward additions and extensions of the fixed assets in Galt. If the mortgage is not placed permission will be sought to sell the property.

**The Abitibi Pulp & Paper Co.** is making good headway in the completion of its new plant at Iroquois Falls, Ont. At present 200 tons of pulp a day are being manufactured and all the structures in connection with both the pulp and paper mill have been completed. The machinery for two paper machines is now assembled and it is expected that these will be in operation not later than April 15. Another machine is expected to be installed by July 15, and a fourth in early September. The combined daily capacity of the plants, when the four paper machines are in operation, will be 250 tons of newsprint, 250 tons of pulp and 75 tons of sulphite. All of the pulp and 50 tons of the sulphite will be used in the manufacture of the newsprint. The surplus 25 tons of sulphite will be sold. Over four-fifths of the company's paper, it is announced, will be shipped to American firms.

**Pulp Mills Busy.**—Sixty-four pulp mills in Canada report a total consumption, in 1913, of 1,109,034 cords of pulpwood. Nearly an equal amount was exported to the United States in an unmanufactured condition. Thus, for the first time in the history of the industry, more than half of the pulpwood produced in Canada was manufactured into pulp in Canadian pulp-mills. Quebec leads in the consumption of pulpwood, followed, in the order named, by Ontario, British Columbia, New Brunswick and Nova Scotia. As the pulp industry on the Pacific coast is still in its infancy, steady increase in British Columbia may be expected. Over two-thirds of the wood used for pulp was spruce, and one-fourth balsam fir. The percentage of fir used has grown steadily, as the prejudice against this wood has been overcome. Jack-pine is also beginning to be a factor, though still a small one, less than 20,000 cords being reported as manufactured in 1913.

**Calgary Exports to U.S.**—A large increase in the exports to the United States from Calgary is shown in statistics just prepared for 1914 by the United States Consul there. From this report it appears that the exports for 1914 totaled in value $4,712,191 and exceeded the exports of the previous year by 350 per cent. In practically every branch of agricultural activity there has been greatly increased production in this dis-

## WANTED

WANTED — SECOND-HAND LATHE, IN good condition. About a 14-inch sweep. Canadian Machinery, 143 University Ave., Toronto.

## SITUATION WANTED

POSITION WANTED AS ENGINEER OF steam or electric power plant; familiar with high-class equipment, including different types of engines, turbines, boilers and electric generators and transformers. Over 20 years' wide experience, good records, disengaged, go anywhere. Address "Engineer," Canadian Machinery. (8)

## FOR SALE

AT EASY TERMS—THE SPLENDID FIVE-storey building situated south-east corner of St. Antoine and Seigneurs Streets, occupied now by the Northern Electric Co., 32,000 feet of floor space, light on two main sides and one end; mill construction; sprinkler system; absolutely fireproof; fire escapes, electric light and elevator; steam heated; large yard next to building if desired. Apply Jos. Bonhomme, 200 Guy Street, Montreal. (4)

3" x 36" JONES & LAMSON LATHE. 20" x 8" geared head single pulley drive. Also quick-change gear Prentice lathe. 16 x 6 Reed lathe. 3—5A Potter & Johnson automatics. All in excellent condition, guaranteed. Dominion Machinery Company, 82 Adelaide Street East, Toronto.

FOR IMMEDIATE SALE AT HALF COST—furniture factory equipment, either separately or complete. Large surface planer, turbine wheel, shafting, lathe and pulleys, good as new, and water power site. John Waddell, Orono, Ont.

SNAPS IN MACHINE TOOLS—ONE 24 INCH x 24 inch x 9 feet Iron Planer. One 30 inch x 30 inch x 8 feet Iron Planer. One 30 inch x 30 inch x 10 feet Iron Planer. The foregoing all of Bertram & Sons' make. One No. 2 Rockford Universal Milling Machine, including vertical attachment and extra cutters. This machine has only been used a few days and is guaranteed in perfect order. Canada Machinery Agency, 298 St. James Street, Montreal. (6)

HOPE CHAMBERS, 93 SPARKS STREET, OTTAWA

trict. Large gains have been made in live-stock, in wheat, flour, hides, meat and rye, while two products appear in the list which have not hitherto previously crossed the border, namely, wool and coal. Hogs show probably the greatest increase, the figures for 1914 being $1,776,172, as against $53,409. Cattle show a big gain, the figures being $1,484,683, as against $317,655 in 1913. Wool exported was valued at $10,000, while coal to the value of $8,562 went over the border, figures which are not large, but are significant when compared with 1913, when neither of these commodities was exported.

# Personal

**J. H. Plummer**, pressdent of the Dominion Steel Corporation, was in Montreal recently.

**Simeon Brubacher**, president of the Berlin Office and Fixture Co., Berlin, Ont., died in that city on February 2, aged 51.

**Geo. H. Cory**, formerly advertising manager of "Coal Age," has been appointed to a similar position with the Wm. B. Pierce Co. of Buffalo, N.Y.

**R. McGregor, of Galt, Ont.**, president of the Stuart Machinery Co., Winnipeg, has been in the West making changes in the personnel of the staff, this being made necessary through the death of Mr. McLeod, former managing director.

**Carl W. Luten**, of Minneapolis, one of the leading experts on reinforced concrete and special consulting engineer to the Provincial Government, visited Saskatoon recently. He will report to the Government on the Twenty-Fifth Street bridge.

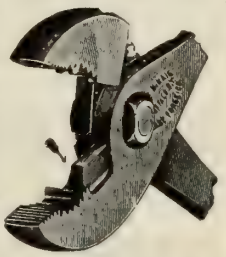
PROTECTIVE PATENTS

Morton Manufacturing Co.
Draw Cut Shapers, Special Draw Cut R.R Shapers, Special Locomotive Cylinder Planers.
Portable Planers, Stationary & Portable Key Way Cutters, Finished Machine Keys.
Office & Works, Muskegon Heights, U.S.A.

McKAIG'S SURE CUTTER
McKaig's Combination Pliers
A new invention, an improvement over the old style. When the cutters on other pliers get dull they won't cut. "SURE CUTTERS" will cut perfectly, no matter how dull the edges get.
When the hold gets loose on other pliers, they won't cut — but "SURE CUTTERS" do the work just the same.
Try them—order now, before you forget it.


McKaig Drop Forge Company
Buffalo, N.Y.

METAL STAMPINGS
We are manufacturers of stamped parts for other manufacturers.
We do any kind of sheet metal stamping that you require. Our improved presses and plating plant enable us to produce the finest quality of work in a surprisingly short time.
We can finish steel stampings in Nickel, Brass or Copper.
Send us a sample order.

## "CANSTEEL"

FIREPROOF INTERIOR EQUIPMENT FOR FACTORY & OFFICE

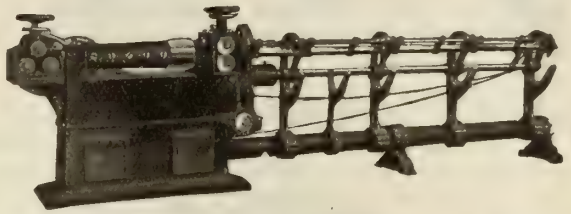
STEEL LOCKERS in your office and factory mean that you will save that time that your employees now waste in storing away their wearing apparel twice every day.

Let us show you how they will prove an investment. An inquiry does not mean any obligation on your part.

Write now before you forget.

**CANADIAN STEEL PRODUCTS CO.**
**227-229 Wellington St. Montreal, P.Q**

## Automatic Wire Straightener and Cutter



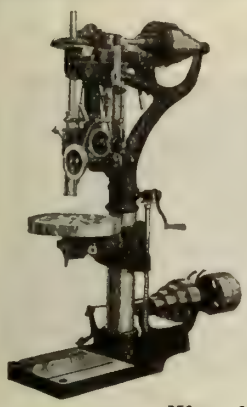
PUT IT TO WORK

cutting up those coils of wire, and let it earn its cost. Every length will be an exact duplicate of the preceding one, and all will be absolutely straight.

Costs little to run, because it requires little attention beyond placing the coils of wire.

Catalogue gives full information.

**The F. B. SHUSTER COMPANY, New Haven, Conn.**
Formerly John Adt & Son. Established 1866.
Also makers of Riveting Machines, Sprue Cutters, Foot Presses, etc.
Canadian Agents: A. R. Williams Machinery Co., Toronto.



## Our 23" Mechanic's Drill

has features with which you may not be familiar.

There are eight speeds provided, with quick advance and return.

Stationary Head and Back geared with automatic stop. This drill can be motor-driven and will drive high-speed drills to their utmost capacity. The quality is the same as all "Rockford" quality—the best.

## CLEVELAND HOSE SPECIALTIES

### Bowes Automatic Air Hose Couplings

Over 1,000,000 in general use

**STYLE O.F.** is an Outside Thread Female Pipe End. Made in sizes ⅜-in. to 1½-in.

**STYLE I.F.** is an Inside Thread Female Pipe End. Made in sizes ¼-in. to 1½-in.

**STYLE H.F.** is a Female Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.

**STYLE H.M.** is a Male Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.

**STYLE O.M.** is an Outside Thread Male Pipe End. Made in sizes ⅜-in. to 1½-in.

**STYLE I.M.** is an Inside Thread Male Pipe End. Made in sizes ¼-in. to 1½-in.

The Male and Female Ends of Bowes Couplings interchange in sizes, ¼-in. to ¾-in. Sizes 1-in. and 1¼-in. interchange. The 1½-in. ends interchange only with themselves.

### BOWES COUPLINGS

Are instantly connected or disconnected.
They are absolutely air-tight under all pressures.
They quickly pay for themselves by stopping costly leaks.
They interchange in sizes most commonly used.
They have no loose parts to be mislaid or lost.
They are made of brass and will not rust.
The U-shaped interchanges in couplings ¼-in. to ¾-in.

### The Cleveland Never Slip Hose Clamp

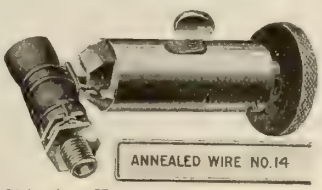
Made in same sizes as Bowes Couplings

The adjoining cut of Never Slip Hose Clamp shows the "Flanges" which engages the groove provided in all hose ends of Bowes Couplings. The "Model Hose Line" illustrated shows correct styles of couplings to use and proper way to attach the clamps.

### CLEVELAND GROOVED HOSE NIPPLE

**Grooved Nipples** when attached to hose with the wire clamp cannot "blow out," as one-half of the Wire Clamp lies in Nipple Groove, and the other half on the hose, uniting nipple and hose permanently. "Blow outs" are expensive, as one to five men are idle while new connection is being made; time wasted, ten to thirty minutes. Can you afford it?

### WIRE CLAMP TOOL



To apply Wire Clamps to Grooved Hose Nipples you need the Wire Clamp Tool illustrated, a small hand-operated tool at moderate cost which we carry in stock for immediate delivery.

In Stock: Riveting and Chipping Hammers, Four-piston Air Drills, Corner Drills, Emery Grinders, Sand Rammers, Holder Ons, Etc.

WRITE FOR BULLETIN NO. 29.

IMPORTANT:—The Small Leaks in your "AIR LINE" mean serious loss in DOLLARS. Have you any idea of the amount of "Air" wasted in small leaks at your connections? Air Leakage through 1-16 in. opening equals 5.32 cu. ft. per minute at 80 lbs. It will pay you to install Bowes Couplings and stop costly leaks.

Write for Catalog No. 12, which illustrates our complete line of Air Tools

## Gashing a 300-Pound Hob

**A Kind of Milling Calling for Rigid Construction and Extra Fine Feeds.**

Not an everyday job, but you know how often the unusual ones like this come up. Here is a special high-speed steel hob 11" in diameter and 12" long. The 10" cutter is taking a V cut 3" deep and 2" wide at top. The cutter teeth are long and very thin, so a feed of only .0059" per revolution can be used. A series of very fine feeds for such work is provided on our heavy, tool-room Milling Machines, in addition to the regular feeds. Also a well-braced one-piece frame, with massive knee, connected to it by stiff arm braces, makes for steadiness under these heaviest cuts.

**OUR MILLING MACHINES ARE READY FOR THE UNEXPECTED JOBS.**

# CENTER GRINDER

**(Improved)**

**CHEAP! PRACTICAL! DURABLE!**

The most popular tool of its kind on the market. Adjusted in a moment.

An occasional use will keep your Lathe centers in perfect order.

## Stow Mfg. Co.

**Binghamton, N.Y., U.S.A.**

Chicago Office, 106 So. Jefferson St.

## The Measure of a Drill

Pick out a drill—its looks, its price, count for little. The measure of a drill is—How many holes will it make?

### Cleveland Twist Drills

measure up because of their well known hole-producing qualities.

*Are you getting "Drill Chips" each Month? If not, ask for it.*

**The Cleveland Twist Drill Co.**

New York Cleveland Chicago

## U. S. Electric Drills and Grinders

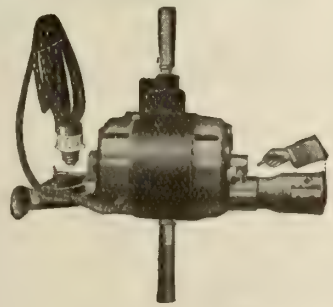
**Save Time, Labor and Money**

They can be attached to any lamp socket.

For drilling in metal they are superior to any other kind of portable drill. Cost 50% less to run than air drills.

**3 SIZES.**

**3-16 inch, W.G.T., 6 lbs.**
**¼ inch, W.G.T. 9 lbs.**
**⅜ inch, W.G.T. 12 lbs.**



All motors wound for 110 or 220 volts Direct or alternating current.

Try a few of our Electric Drills and Grinders and you'll send us an order for more. Our guarantee protects you.

**½ inch—2 SPEED.**

**Speed, 400-750 R.P.M.**

MONTREAL, P.Q.

"The Roll of Honor"

The reputation of the W. H. Johns-Manville Company has been earned by an unwavering purpose to make only the best materials. Its record of over half a century of roofing achievements is unparalleled, and the full force of this record is behind each roll of

J-M ASBESTOS ROOFING

To ask for "J-M" is synonymous with asking for "the best money can buy." There is not a single doubtful inch in any roll of J-M Asbestos Roofing. Made from pure Asbestos Rock and Trinidad Lake Asphalt, it is literally a sheet of pliable stone. Being rock it endures on its own inherent qualities and requires no protection, such as paint, gravel or sand.

Gives excellent fire protection. This roofing keeps a building from 15 to 30 degrees cooler than ordinary roofing, because its white surface reflects the heat and because of the remarkable insulating properties of Asbestos. Furnished in ready-to-lay or built-up form. Former easily applied by means of J. M. Cleats packed FREE in each roll.

Every roll made by a company whose only known standard has always been "Honest Quality."

Users of rubber type roofings can get J-M quality in J-M REGAL ROOFING

JOHNS-MANVILLE SERVICE COVERS THE CONTINENT

THE CANADIAN H. W. JOHNS-MANVILLE CO., LTD.

TORONTO MONTREAL WINNIPEG VANCOUVER

14" Improved Wet Tool Grinder

Modern design and heavy construction, with self-oiling bearings throughout, and equipped with our well-known vertical centrifugal pump, which furnishes a constant supply of water which can be regulated to suit work being done. The propeller of this pump is loosely fitted, and does not touch the case at the nearest point. A sleeve cap prevents leakage without the use of packing

Our 14" Improved Wet Tool Grinder is designed to carry 14" x 1½" wheels, and a Special Rest is furnished, to be used in connection with a Huntington or other wheel dresser of similar design. Also built in 20" and 30" sizes. Can be fitted with a 1 H.P. constant speed motor.

WRITE FOR FULL PARTICULARS AND PRICE.

J. G. Blount Company

Everett, Mass., U.S.A.

16 in. Lever POST DRILL

A Giant Little Machine For Light Drilling.

Will drill up to ⅞ inch.

The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

Drills to centre of 16-inch circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 23 inches.

Spindle bored for ½-inch shank twist drills.

Speed of countershaft for average work, 300 per minute.

WHEN you need new equipment or supplies for your machine shop

**Consult this Directory**

¶ You'll find listed here the reliable makers of the lines you need; firms who believe in the progressiveness of present-day manufacturers and who appeal to their intelligence through their own engineering journal.

¶ Consult Canadian Machinery Buyers' Directory and you can't go wrong in your buying.

## Make One Barrel Do What Two Barrels Did Before

THE minute you install one Globe Tumbling Barrel you can pension two of your old-fashioned horizontal barrels and still do a wider variety of work —and do it a great deal better and many times faster.

**GLOBE TUMBLING BARRELS**

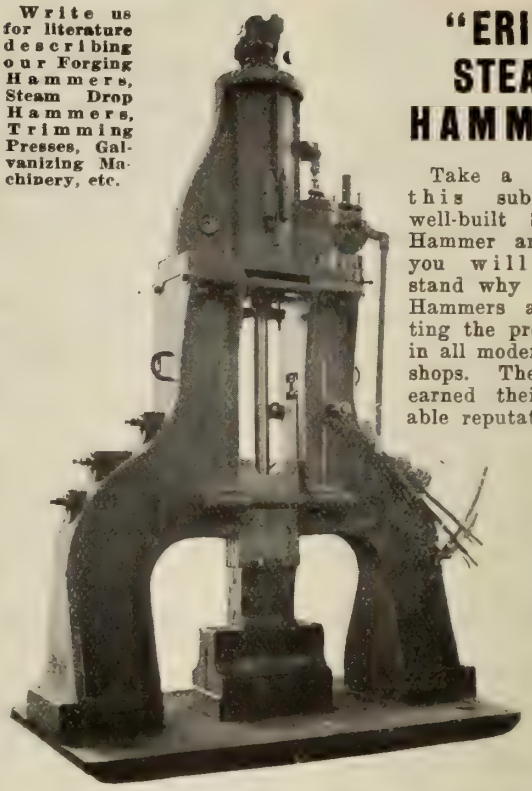
save time because they don't have to be stopped for filling, emptying or inspecting of the work. They save floor space, because they stand vertically and occupy little room—and they save money, because they require a smaller investment in barrels.

**Eight stock sizes, $50 to $170. Our Booklet 2 contains useful information on tumbling — shows the different styles of Globe Barrels and tells what each will do. Write for a free copy to-day.**

**The Globe Machine & Stamping Co.**
**Cleveland, Ohio, U. S. A.**

**Write us for literature describing our Forging Hammers, Steam Drop Hammers, Trimming Presses, Galvanizing Machinery, etc.**

## "ERIE" STEAM HAMMERS



Take a look at this substantial, well-built Steam Hammer and then you will understand why "Erie" Hammers are getting the preference in all modern forge shops. They have earned their enviable reputation.

**Erie Foundry Company, Erie, Pa.**

# ELECTRIC STEEL CASTINGS

E S & M
BRAND

**Stands for Quality.**

High-Grade Steel Castings of every description.
Clean, Sound, and true to pattern.
From 1 lb. and upwards.

Manganese and all Alloy Steel Castings, Mining Bar and Rock Drill Steel, Forging Ingots.

**WRITE FOR PRICES AND PARTICULARS.**

# No, Stevens' Stopper won't stop a train, but it will stop the blow hole in a defective casting so that you cannot find it.

In this way, it helps your bank account. The casting that otherwise would have to go to the scrap heap can be converted into good coin of the realm.
Same color as the rest of the casting. Doesn't look like a blue patch on Casey's faded overalls.
*How to use Stevens' Stopper, or Circle Cement:*
Stevens' Stopper is a fine powder, used with a little water and made into a paste—the hole is easily filled with a putty knife or trowel. It takes anywhere from two to twenty-four hours, depending upon the size of the patch, for the filler to become as hard as the casting itself. When rubbed with a file it shows the color of the casting, hence it is the best filler and the one thing that saves your castings, and that means the saving of your dollars.
Another thing—I do not ask a fancy price for it.
A pound will save many dollars' worth of castings. Put up in 5-lb., 10-lb., and 25-lb. cans.

## They Selected an Aloxite Grinding Wheel

To grind out the ball races in case-hardened steel discs in a Connecticut plant—chose it because it cut clean, held its shape so well that the ball race was always ground true and smooth—and because it cut so fast that the operator ground 200 pieces per hour.

## ALOXITE IS THE WHEEL FOR STEEL

Our service department will see to it that you get the right wheel in the right place no matter what your grinding conditions are.

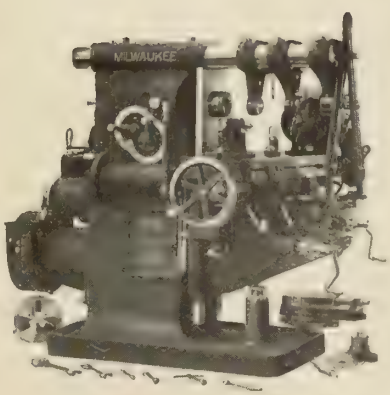
# Milwaukee Millers



## THE DOUBLE OVER ARM

The double over arm is an exclusive feature of Milwaukee Millers. It consists of two steel bars arranged accurately parallel with the spindle, providing for positive alignment of the arbor and preventing it from being pounded out of line. It is impossible for the operator to place the arbor supports on the arbor and double over arm in any other position than exactly in line.

In addition to providing positive alignment of the arbor, the double over arm construction makes it practical to use large diameter cutters at a greater distance from the face of the column, permitting the finishing of a variety of work on Milwaukee Millers that would otherwise have to be taken to a planer.

*Write for a copy of Catalogue No. 19. It illustrates and describes Milwaukee Millers and attachments in detail.*

# Why P. & W. Taps Win

## It's in the Design

One-third of the land from the cutting edge is concentric.

*The remaining two-thirds has eccentric relief.*

The taper-tap has a cylindrical pilot.

The taper- and plug-taps have an eccentrically relieved chamfer relieved clear from the cutting edge.

The highest grade of steel obtainable is used.

## What It Means to You

Taps can be sharpened at the only correct point—on the face of the cutting edge.

Sharpening in no way affects their size.

Can be sharpened long after other so-called eccentrically relieved taps are rendered useless.

We obtain the freest cutting tap with the longest life—an exclusive combination.

Accuracy nowhere else obtainable is secured together with a degree of finish and refinement heretofore thought impossible in a commercial tool.

For a number of years we have made taps with this style of relief. They have won out steadily and consistently on merit alone.

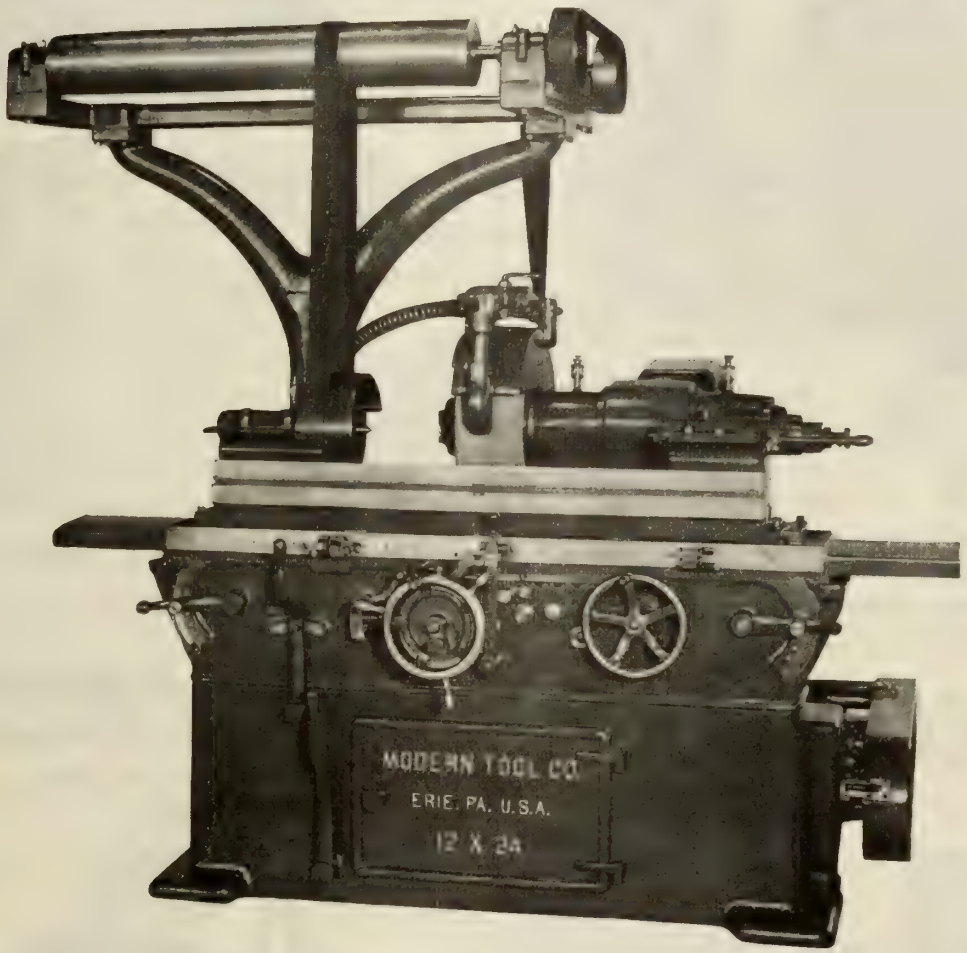
# Finishing Shrapnel Shells

ON THE

## "MODERN" 12" x 24" Self-Contained Grinding Machine



## The heaviest, most powerful and efficient Standard Grinding Machine made for Shell work

The "MODERN" 12" x 24" Grinding Machine is especially adapted for grinding Shrapnel Shells. The Machine is more than guaranteed, it is demonstrated. Large diameter, wide face wheel, with powerful drive—automatic feed without traversing the table—absolute central control of all levers and hand wheels—single constant speed drive.

We have recently sold a large number of these Machines in Canada, completely equipped for Shrapnel Work. Ask the man who is using the "MODERN."

The large manufacturer appreciates the production possible on this Machine. Machine comes equipped for all classes of straight and taper cylindrical work.

**Send for blue prints and estimates.**

# Modern Tool Company

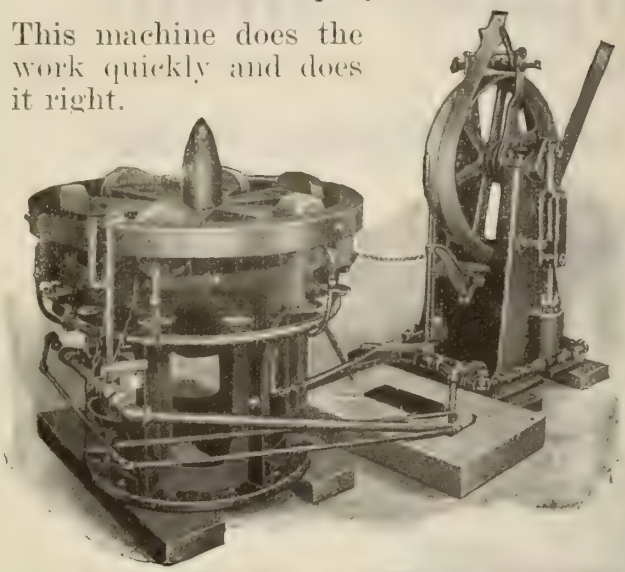
**Main Office and Works: State and Peach Streets, Erie, Penn'a.**

**Canadian Agents: Rudel-Belnap Machinery Co., Toronto and Montreal**

## Hydraulic Banding Machine

**For compressing bands on shrapnel shells and other projectiles**

This machine does the work quickly and does it right.



In writing for information or quotation please advise width and thickness of bands and diameter of shells to be handled.

Machines for our Canadian Customers are built in Hamilton, Ont.

We also manufacture machines for setting wagon and carriage tires, cold.

**Please address all communications to our Rochester Office.**

**THE WEST TIRE SETTER COMPANY**
ROCHESTER, NEW YORK

## Particularly Adapted to the Manufacture of Shrapnel

**Four-Sided Tool Posts Transform Any Engine Lathe**

One of our patented Quick Change Tool Posts, with its exclusive revolving features, will earn far greater dividends on your investment than a quick change gear.

We fit them to any make or size of lathe, old or new, and thereby transform it to a modern multiple-production machine.

*A big convenience for a small price. Send for our new Booklet and full particulars.*

**Fay & Scott, Dexter, Me.**

# ACCURACY

Because a small diameter screw enters the tapped hole is no guarantee that it fits properly.

The pitch may be long or short, and therefore cause resistance, but be a poor fit.

Cap and Set Screws should fit all the way like a shaft in its bearing.

"Galt Screws do. Try them."

# Keeping In Your Public's Eye and Mind

is half the battle; the other half is in carrying a message that it will listen to and heed.

The message starts 'way back in the shop—in a deserving product and good business methods—and this is the first, most important equipment of the fight for business.

The other half, without which any decisive victory is well-nigh impossible, is made comparatively simple by the fact that your particular public has been so sorted out and classified that you know exactly where to find it.

Your public, the few thousands who are of direct business value to you, are selected automatically from the millions who have no possible interest in your product, and, so far as your purposes are concerned, are brought together at regular intervals for deliberate and serious consideration of their business problems.

They are told, by those whose opinions they respect, how to do things better, quicker or cheaper. They are told how others in their line have profited by the adoption of new methods. They are given information of vital value—information for which they gladly pay; and then the opportunity is open to you—while the whole matter is fresh in their minds—to tell them just how your product fits into the plans presented.

There are few paid subscribers to any trade or technical publication who are not actual or potential buyers—few whose purchasing power or influence can be safely ignored, and few even of the few who "don't read advertisements" who are not influenced by them.

The subordinate of to-day is the department head of to-morrow, and the work of educating him is done while the work of convincing to-day's buyer is going on, for both are readers of a trade or technical paper.

*The advertiser would like to know where you saw his advertisement—tell him.*

# Relative to Cam Grinding and Cam Grinding Equipment--IV.

By Howard W. Dunbar.

*The purpose of this series of articles is to describe as clearly as possible the methods employed by the Norton Grinding Co., Worcester, Mass., in the production of the master cams which are used for cam grinding. There are doubtless many of our readers whose knowledge of the subject will be materially increased thereby. Text and cuts, courtesy Norton Co.*

THE rapid change in the design and improvement in gas engines from the earlier types of a single cylinder to the present-day modern engine of four, six and even eight cylinders has called for a corresponding change in grinding equipment so that to-day to meet the needs of gas engine manufacturers in accurately and rapidly producing hardened steel cams, grinding attachments are manufactured by the Norton Grinding Co., of a loose cam type in four sizes and of an integral type in two sizes with two methods of driving. These attachments are equally good, however, for the production of any style of peripheral cam or irregular shapes within their capacities. They not only finish grind the hardened cam but are also capable of economically roughing out the shape from a forging, and in most cases even from a cylindrical piece of stock.

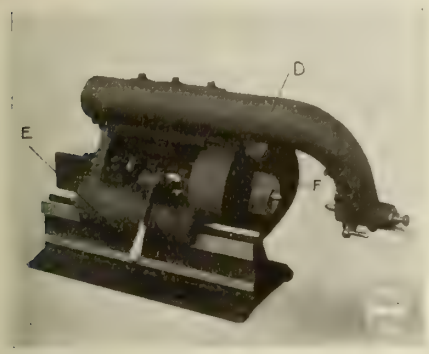

FIG. 1. FRONT VIEW NO. 2. LOOSE CAM ATTACHMENT.

### Loose Cam Attachments.

All the loose cam attachments are of the same general design and operation, differing only in their mechanical construction, dimensions and capacity, and because we will treat in detail later the more widely used integral attachment, the principles of operation of which are identical with the loose cam attachment, but a brief description is here given.

Figs. 1 and 2 show the No. 2 Loose Cam Attachment front and rear view as it appears on the machine. Motion is transmitted to the attachment by the headstock through the crank at A. The hardened master cam which produces the desired shape on the cam blank is mounted at B, and the attachment oscillates on the trunions C. The work to be ground is mounted on the centres, and is supported by the overhanging arm D. Rigidity and wear are big factors in the accuracy of the work produced, so here we see a fixture with weight, strength and stability, with large and accurately made bearings. Means are provided for lifting the work away from the grinding wheel by lever E. The cam is driven by dog. F, the proper speeds being obtained through the regular speed change mechanism in the head stock.

The several attachments have a capacity in swing of 1⅝ in. 2⅞ in., 5 in. and 7 in., and in lift of ¾ in.. 1⅜ in., 1½ in. and 3 in. (see Fig. 3), and are adapted for use on the 6 in., 10 in., 14 in. and larger machines.

### Integral Cam Attachment.

The advent of the forged cam shaft having a number of cams integral with the shaft made necessary the development of a fixture to grind these cams, and so the integral cam grinding attachment was designed taking its name from the style of cam shaft it was to handle.

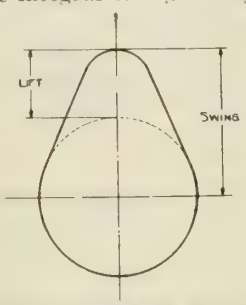

FIG. 3. LIFT AND SWING DIAGRAM.

Two types and two sizes are manufactured, the two types differing only in the method of driving—one getting its power through the headstock of the machine, while the other is belted direct from overhead. Both have their advantages.

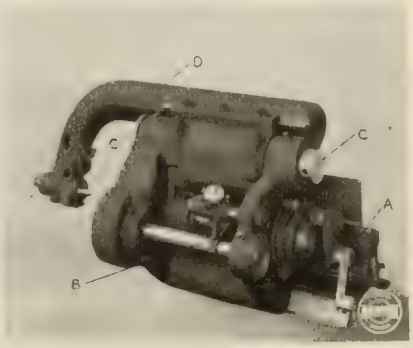

FIG. 2. REAR VIEW NO. 2. LOOSE CAM ATTACHMENT.

Where a variety of work is to be done the first is recommended, as it is possible by simply removing the attachment from the table of the machine to be ready to handle any form of cylindrical grinding, while in the latter the head and footstock of the machine are omitted and the attachment occupies the entire table surface (making possible a shorter machine), and is confined to the grinding of cam-shafts where large quantities are required. In size the attachments are capable of swinging 2 in. and

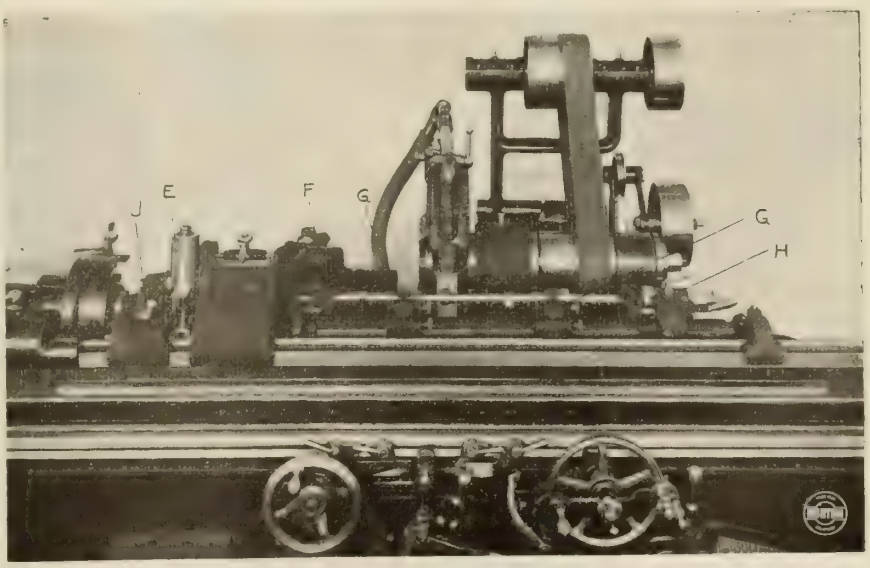

FIG. 4. ATTACHMENT ON MACHINE IN OPERATING POSITION.

2 3-16 in., with a lift of 7-16 in. and $^3/_4$ in. (see Fig. 3), and will handle camshafts up to 58 in. over-all length, having from one to fourteen cams to be ground. They are adapted for use on 10 in., 14 in. and larger machines.

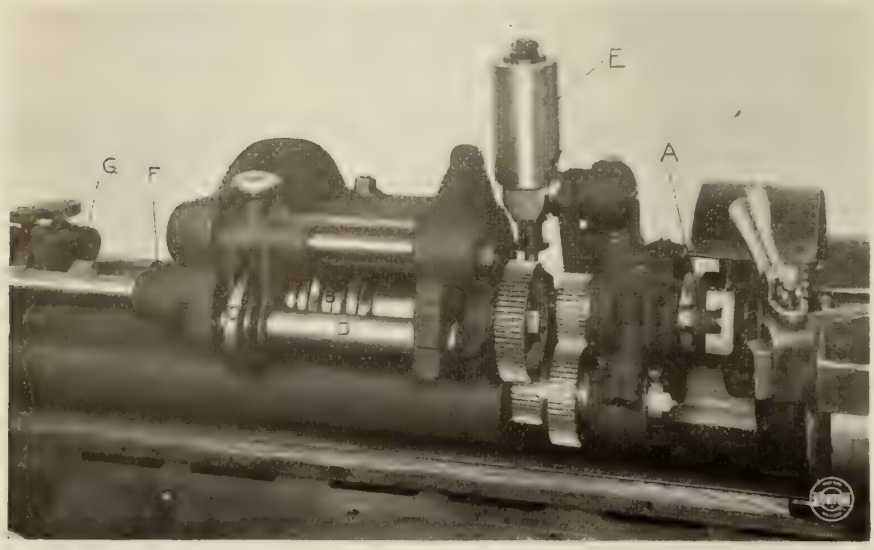

FIG. 5. NEAR VIEW OF REAR OF HEADSTOCK END OF ATTACHMENT.

The greatest length shaft that an attachment will handle is determined by the length of the machine. However, attachments to handle shafts longer than 58 in. are not recommended, because even though the attachment is stiff, and strong enough to prevent twisting, the cam-shaft in itself is inherently so weak that in grinding the cam farthest removed from the drive there is a spring that would make it impossible to grind all cams within the degree of accuracy generally required.

Fig. 4 shows the attachment on the machine in operating position. Fig. 5 is a nearer view of the rear of the headstock end of the attachment, on which A is the driving arm; B the master cams on the master cam spindle, and C the roll which is quickly located before the proper cam by sliding along shaft D as illustrated in detail by Fig. 6. The spring encased, which holds the master cam snugly against the roll is shown at E, while F shows the driving dog in position, G the steady rests, and H the footstock, which is movable to allow for different lengths of cam shafts, which are carried on the centres of the attachment. As the master cams revolve and bear against the roll, the attachment oscillates about the centres X in Fig. 7, which shows the end view in detail of the attachment.

The wheel is fed into the work with the wheel feed index by the operator gradually bringing it in until the desired shapes are produced; handle J being provided to lift the work away from the wheel when it is desired to inspect during the process of grinding, or to move the roll from one position to another.

Let us assume that we have a four-cylinder cam-shaft to grind, then in addition to the machine and attachment, the following equipment is necessary:

One driving-dog for roughing and finishing.

Two steady rests (number varies under different conditions).

Two work shoes for roughing.

Two work shoes for finishing.

One set of master cams on spindle.

### Dogs.

Fig. 8 illustrates the type of dog generally used for roughing and finishing. In assembling on the shaft, care must be exercised to see that it bears the proper relation to the cam to be ground. This is taken care of by the keyway shown. It is most important that no lost motion take place between the driver and the shaft, and to provide against this and also for any wear which is liable to appear, a clamp and set-screw are provided. It is self-evident that the dog is readily removed from the shaft.

Under some conditions, it is necessary to use a roughing dog. Notably among these is the flange type cam-shaft. On such a shaft we cannot use the type of dog illustrated, but must have a special one. All such cases are special and have to be treated individually.

### Steady Rests.

Too much importance cannot be placed on the question of steady-resting, as on it depends much of the accuracy of the product. Much thought should be given to the number required (depending upon the length and slimness of the shaft) and the proper place to locate them with reference to the points to be ground.

There are two general types used—the open and the closed—shown in Fig. 9.

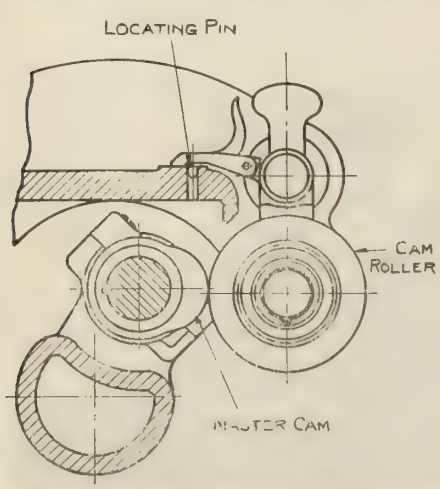

FIG. 6. SHOWING MASTER CAM, LOCATING PIN, AND CAM ROLLER.

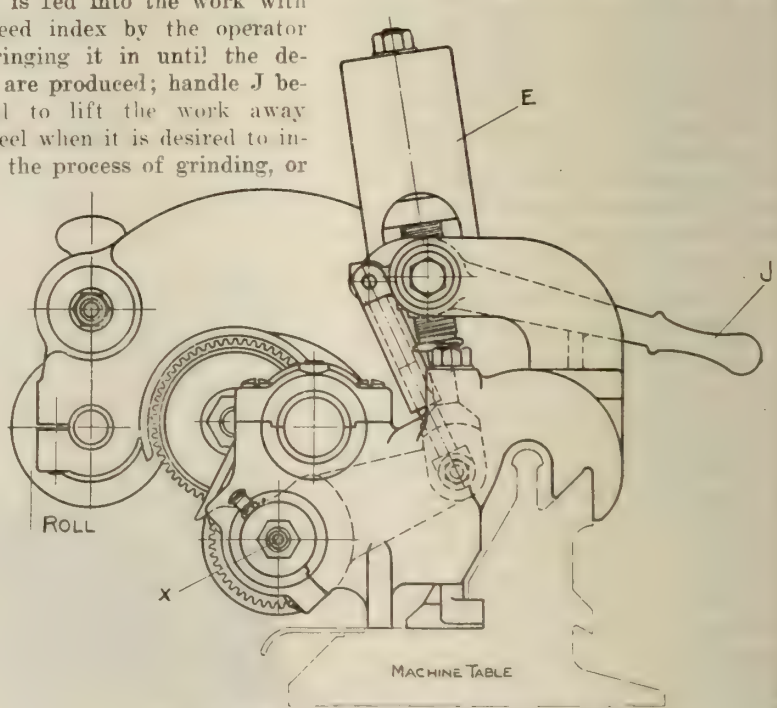

FIG. 7. END VIEW OF ATTACHMENT IN DETAIL.

The open type has the advantage of being more easily handled in putting in and taking out the work, and gives very satisfactory results, and where a degree of accuracy is required, bordering on perfection, the closed type is recommended, and is generally used on the

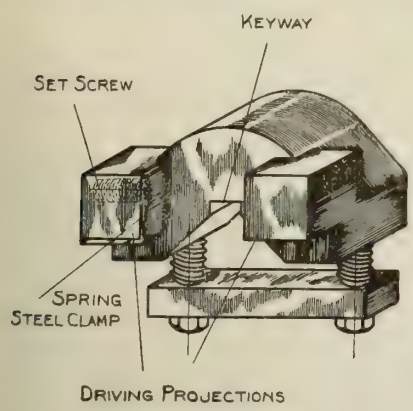

FIG. 8. TYPE OF DOG USED FOR ROUGHING AND FINISHING.

same bearings used in the engine. Of course, it is obvious that with this goes a greater time required in handling. Hardened steel work-shoes are shown at A and the adjusting screws at B, element C being adjustable in and out and up and down.

### Work-Shoes.

Ordinarily, hardened steel work-shoes are supplied, but in some special cases it is necessary to use bronze. The shape generally used is shown in Fig. 10. It is important that the bearing point A be diametrically opposite the grinding wheel to take the pressure in that direction, and that the point B be on the opposite side of the vertical centre line to support the shaft and steady it in the direction of rotation of the wheel. As the shaft comes to the grinding machine it is generally roughed out and left a little over size to allow for hardening, spots always being provided for the work-shoes to bear on. The cams are then roughed to their approximate contour, leaving them slightly over size, after which the shaft is hardened and the bearings ground to size in a machine using regular equipment. We are then ready to finish grind the cams, using the finishing shoes which are the exact size of the bearings on the cam-shaft.

### Cam Grinding Wheels.

The wheels used in grinding cams depend upon many things—the accuracy required, the finish, the operator, the machine and the material the cams are made from, but as it is not the purpose of this article to discuss wheels, the subject will be treated but briefly. It is important that the wheel should always be 18 in. in diameter (except on the No. 1 loose cam grinding attachment, when it is 14 in. diameter), the width of face depending upon the width of cams to be ground, and any projection on shaft that might interfere with the wheel.

Variations from 18 in. in diameter will produce results as in Fig. 11 (exaggerated to illustrate the principle), showing that with a wheel larger in diameter than 18 in. a convex faced cam will result, and with a smaller diameter wheel a concave faced cam. It will be apparent, therefore, that the nearer 18 in. in diameter, the nearer perfection; and the same amount of wear allowable is dependent on the variation in contour permissible. One inch worn from the diameter of the wheel does not affect the lift or opening points appreciably, but it is true that by any practical known method of cam grinding a change in the diameter of the wheel, be it ever so small, changes the contour of the cam.

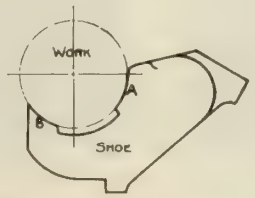

FIG. 10. WORK SHOE FEATURE.

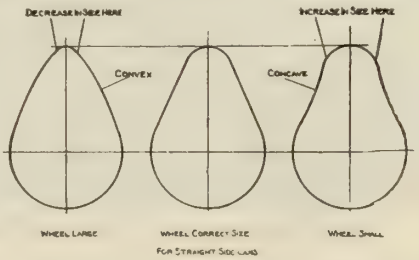

FIG. 11. WHEEL DIAMETER EFFECT DIAGRAM.

A medium soft wheel is best suited for this work as being capable of greater production and accuracy, presenting a truer surface. As a general rule the wheel should revolve at approximately 6,500 s.f.p.m. For roughing the work, speed is not so important, and can be run moderately fast around 40 to 60 r.p.m., but, for finishing, considerably lower speed should be used, say about 15 to 20 r.p.m. These speeds, however, are best determined in each individual case by trial, and depend upon the degree of accuracy required and the kind of wheel being used. The speeds given only apply to the grinding of integral cams.

The size of the cams and conditions in the loose cam grinding attachment vary with each case, so no definite information pertaining to speeds can be given. It is common practice to run the work much faster than the speed mentioned, and in addition use a hard wheel, but if genuine accuracy is required, such methods cannot be followed.

### Important Suggestions.

The centres in the cam-shaft should always be as large as is consistent with its size, and as perfect as possible, as no work will be more accurate than the centres are. The centres in the attachment should be kept clean and well lubricated, and it goes without saying that they must be kept absolutely concentric. There have been many cases where this was not observed, and complaint made that the master cams were not correct.

Care should always be taken to see that everything is properly oiled. Do not put oil on the master cams or the roll surface as it collects dust and will produce inaccurate work. Always keep everything clean; never leave the machine without cleaning thoroughly all parts of the attachment.

Bear in mind that each individual master is made for a special cam on the cam-shaft, and that by the system of marking the master cams, the holes in the attachment have the same numbers as the masters. No. 1 master makes cam on the extreme right-hand end of the cam-shaft as placed in the machine, No. 2 the next to the left, No. 3 the next, and so on.

Be sure that the attachment is securely fastened to the table of the machine;

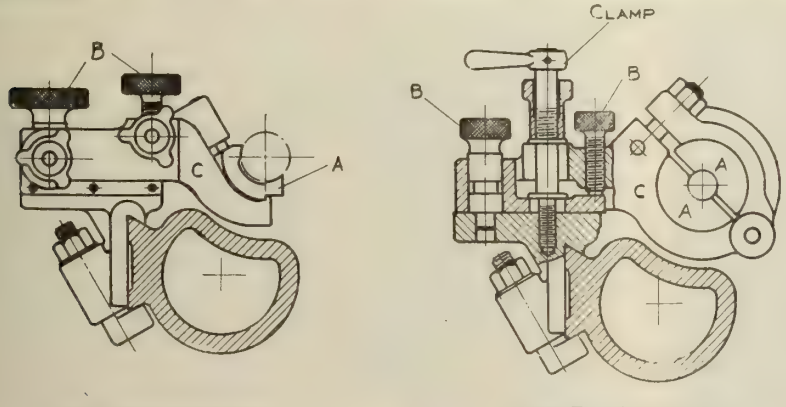

FIG. 9. GENERAL TYPES OF STEADY REST.

rigidity means accuracy. True the wheel frequently enough to have a good true surface. Generous use of the diamond brings satisfactory results; anything but an absolutely true cylindrical shaped wheel will not give perfect work. Be sure that steady rests are securely fastened in place and are **steady** rests, and the work shoes have a good bearing on the work.

Let plenty of compound flow on the work and wheel while grinding. It not only lubricates but carries away the heat generated, thereby keeping the work at a uniform temperature. Changes in temperature mean changes in the correctness of the product.

The foregoing suggestions may seem fussy, far-fetched and unnecessary, but stop to think we are dealing with dimensions by tens of thousandths which are scarcely measureable. The production of cams is a refinement in itself and must of necessity have refined equipment. It is effort wasted for anyone to attempt to produce cams accurately by a rough and hustling method. Cam-shafts of a medium and indifferent quality have been produced by a rapid work revolution, hard wheel and a forcing policy, but no one should criticize the master cams, attachments or machine, if such practices are followed.

## TEST OF DRILLS FOR CAST IRON.

By A. W. Brayshay.

THE following tests were made to obtain a standard to compare drills offered by different makers and by which improvements in drills might be readily noted. The tests were made under working conditions as to materials, feeds and speeds. Testing to destruction does not necessarily show the best drill, and much information of value for regular work is lost where the ordinary routine is departed from. Undoubtedly the most valuable test is that under ordinary working conditions when very carefully, accurately and fully noted.

The tests were made on a new central thrust 4 ft. 6 in. radial machine of ample power and rigidity. The castings drilled were of the same design, size, weight and thickness. The metal varied not more than might be expected in any twenty or thirty castings, each weighing about 1,120 lb. Two drills from each of two makers of repute were taken, and the following particulars are of the drills before testing:

| Drill | No. 1 | No. 2 | No. 3 | No. 4 |
|---|---|---|---|---|
| Maker | X | X | Z | Z |
| Diameter | 1⅛ in. | 1⅛ in. | 1⅛ in. | 1⅛ in. |
| Price net | 10s. 10d. | 10s. 10d. | 10s. 4d. | 10s. 4d. |
| Total length new | 12 in. | 12 in. | 11¾ in. | 11⅞ in. |
| Length from shoulder | 7 11-16 in. | 7⅝ in. | 7 3 16 in. | 7 3-16 in. |
| Weight new, grammes | 879.4 | 851.9 | 879.8 | 874.5 |
| After first test— | | | | |
| Weight after grinding | 878.4 | 850.9 | 878.8 | 873.8 |

The following particulars did not vary throughout the test:

| | Light | Loaded |
|---|---|---|
| Amperes | 12 | 20–25 |
| Revolutions | 200 | 192 |
| Feed per minute, 1⅛ dia... | 58.9 | 56.54 |
| Feeds per inch | 48 | 48 |
| Feed per minute, inches.... | 4.167 | 4 |

Distance through holes, 1¼ in.
Time per hole, 20-22 seconds.

**First Test.**

| | No. 1 | No. 2 | No. 3 | No. 4 |
|---|---|---|---|---|
| Number of holes before failure | 162 | 128 | 212 | 48 |
| Weight of drillings in pounds | 53¼ | 41¼ | 71 | 16¾ |
| Analysis of drillings, Si | 2.20 | 2.44 | 2.42 | 2.26 |
| S | 0.075 | 0.066 | 0.084 | 0.065 |
| Sclerescopic hardness, each result the average of twenty tests | 45.5 | 45.4 | 48.5 | 46.65 |

**Second Test After Re-grinding.**

| | No. 1 | No. 2 | No. 3 | No. 4 |
|---|---|---|---|---|
| Number of holes before failure | 100 | 50 | 144 | 35 |
| Weight of drillings in pounds | 39 | 20¾ | 56¾ | 13¼ |
| Analysis of drillings, Si | 2.38 | 2.49 | 2.53 | 2.39 |
| S | 0.071 | 0.071 | 0.060 | 0.065 |
| Sclerescopic hardness, each result the average of twenty tests | 48.2 | 51.55 | 45.75 | 47.2 |

**First Test.**

| Amperes. | No. 1 | No. 2 | No. 3 | No. 4 |
|---|---|---|---|---|
| 1st hole | 20 | 22 | 22 | 20 |
| 50th hole | 20 | 23 | 23 | .. |
| 100th hole | 22 | 24 | 24 | .. |
| 150th hole | 22 | .. | 23 | .. |
| 200th hole | .. | .. | 24 | .. |

**Second Test.**

| Amperes. | No. 1 | No. 2 | No. 3 | No. 4 |
|---|---|---|---|---|
| 1st hole | 22 | 22 | 22 | 22 |
| 50th hole | 24 | 25 | 23 | .. |
| 100th hole | 25 | .. | 24 | .. |

Note.—Amperes and volts (240 D.C.)÷746= horse-power consumed.

In every case the drill was ready for re-grinding at 25 amperes, and the amount of drill ground away was about .01 in. Drills Nos. 1 and 2 have the advantage of 7-16 in. length from the shoulder, which would allow them to be reground several times more than Nos. 3 and 4. Drill No. 3 showed splendid results, but they were more than balanced by the failure of No. 4 by the same maker.

Taking the various factors carefully into consideration, the results show drills Nos. 1 and 2 to be more regular and consistent, and as samples to give better promise of the quantity than Nos. 2 and 3. As a standard by which to compare drills, 1⅛ in. diameter 150 holes, 1¼ in. deep, at 192 revolutions, 4 in. feed, an average cast iron may be accepted.—The Engineer.

## ADJUSTING MEN TO CONDITIONS.

IN a contribution to the current month's issue of "System," entitled "Adjusting Men to Conditions," F. R. Hazard, president the Solvay Process Co., epitomises the human side of shop management as follows:

Men who fall down on their jobs are not necessarily drones. Three causes not entirely of their own making may be behind their apparent incompetency.

First, they may be round pegs in square holes. That the man and the job must fit is an old story. Still, how many of us list the job's requirements and the man's abilities before we pass judgment?

Secondly, jealousies may have taken all the attractiveness out of the work. A foreman, for instance, may not have been big enough to train up somebody for his job. The men under him see that he is afraid to risk his own pay envelope and so the men lose the incentive they deserve.

Thirdly, an unhealthy spirit may have spread dry rot and stagnation through the entire organization until the best men are the first to become disheartened. There must be a healthy esprit de corps if a business is to swing ahead into its fullest opportunities.

Each one of these causes, and others about as self-evident, must be taken into account before a man is written down a drone.

We say that a manager "works well with men" when he makes these everyday adjustments that give the best answer we know how to get to the human equation problem. They do not usually come "just natural" to a manager, I think. He may use them almost as a matter of second nature, but he knows that he is using them.

The wise manager has an understudy for each position above a certain point, but below that point, in a large proportion of the vacancies, men must be trained when gaps occur. Not every business man sees that the cost of this training is very real. Here in our business we find that it costs anywhere from $50 to $200 to train each new man.

**German Shrapnel.**—In an ordinary shrapnel shell the interstices between the bullets are filled with melted resin or other gum compound, but the German shrapnel shell presents special features. In it the resin is replaced by a high explosive, usually T.N.T. The fuse is so arranged that the shell may act as a time shell or an impact shell, and there is added to the fuse a delay action so that the shell if required may burst a considerable time after impact.

# PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

## DEVICES FOR FINISHING SPHERICAL SURFACES.

By Avery E. Granville.

IN our February 11 issue, the devices and attachments employed in turning the end of a ball lever, and for ball grinding, were described and illustrated.

### Turning Larger Spherical Surfaces.

Another device intended for turning larger and heavier work than previously described is shown in Fig. 5. The work is mounted between lathe centers, and the two surfaces on opposite sides of the piece A are turned so as to produce a truly spherical surface as the word is understood in the shop. The rotary movement is obtained by means of the large worm-gear B, which is centered on the lathe cross-slide exactly under the ball to be generated. This worm-gear is turned by means of a ball crank C mounted on the same shaft as worm D which meshes with the gear. The entire mechanism may be run in or out by means of the regular cross-slide screw. The cutting tool is mounted in a block E set on a slide F on the worm gear, so that it may be set with relation to the centre by means of the adjusting screw G.

A device made on the same principle as the one just described, is shown in Fig. 6. This differs considerably in form however, and is also made to use either hand or power feed, the latter being made possible by the uninterrupted surface to be finished. The cutting tool is mounted and adjusted in about the same way, but besides the hand crank A which may be used at any time, there is a pulley B fastened to the worm-shaft. This pulley is belted to a pulley C, mounted in place of the cross-feed ball crank. With the tool properly set and the cut started, the cross-feed is thrown in, the pulley C starts to revolve, and from it the ball turning tool is gradually carried around the ball being turned.

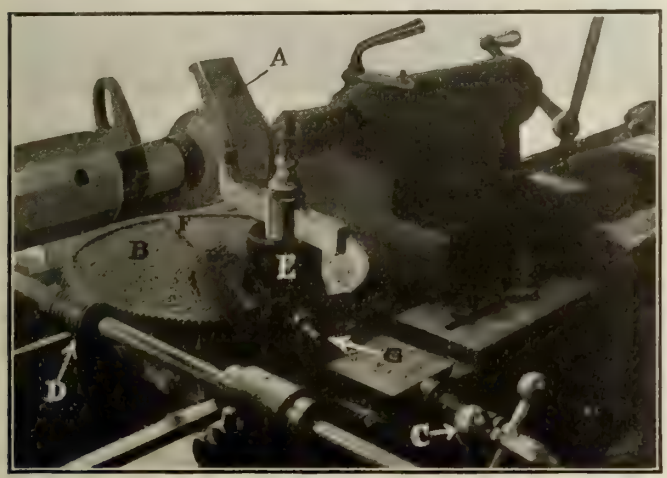

FIG. 5. A ROTARY TURNING TABLE.

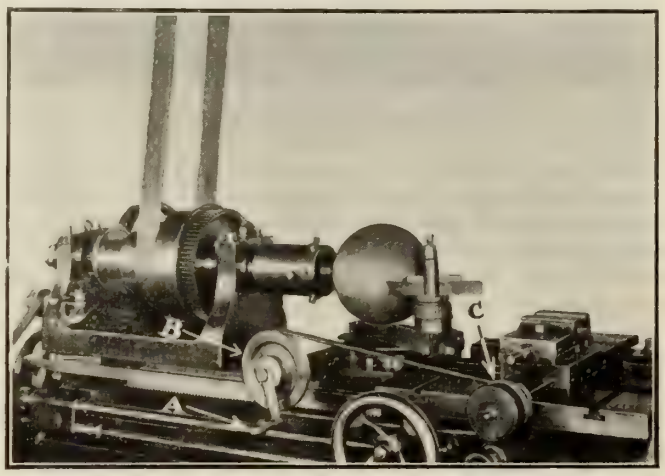

FIG. 6. BALL TURNER WITH POWER FEED.

### A Cam Arrangement.

The device shown in Fig. 7 is useful where a true sphere is not required, or where the radius of the surface turned would make a rotary turner of awkward proportions. The forming or master cam, is placed at A. This is mounted on a bracket B bolted to the lathe bed. A follower pin C is carried in a heavy piece of bar attached to the tool carriage slide. The cross-feed screw is removed and the tool carriage held back by means of a weighted cord D, which runs over the pulley E. Traverse movement of the carriage is all that is necessary to produce the cut desired, so that power feed may be used if advisable. The tool itself may be fed out or in by means of the compound rest.

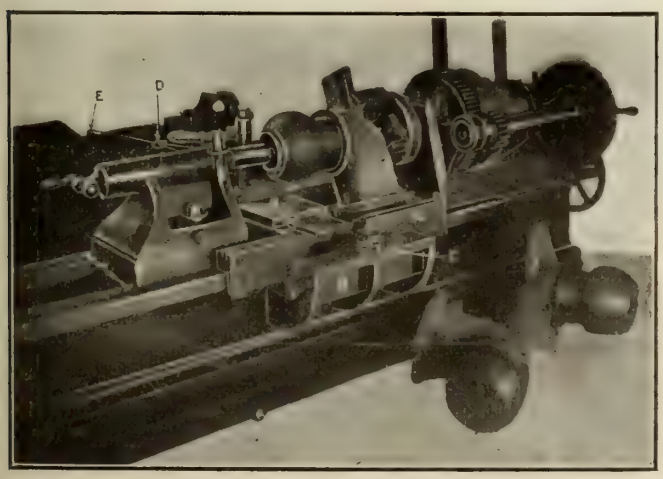

FIG. 7. A CAM ARRANGEMENT.

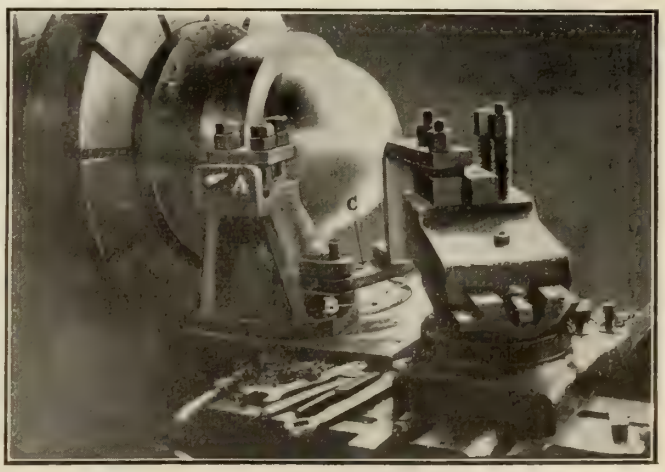

FIG. 8. TURNING A 12-INCH PINTLE.

### Turning Nickel Steel Pintles

The work shown being turned in Fig. 8, is a nickel steel pintle for a Panama Canal gate, the spherical surface when finished, being 16 inches in diameter. The cutting tool is carried in the bracket A which is made of steel. This bracket travels in the groove B, being pulled around by the movement of the cross-slide to the compound rest of which it is attached by the link C. The operation of this device will be better understood by reference to Fig. 9, where the position of the parts at the end of the cut is shown. These pintles are made from huge forgings, large enough to form three pieces. These are roughed out in a lathe as shown in Fig. 10. After being turned to approximate shape, the pintles are parted and finished as shown. The last illustration shows a pintle just being parted from the other two, blocks of wood being placed under it to ease the drop.

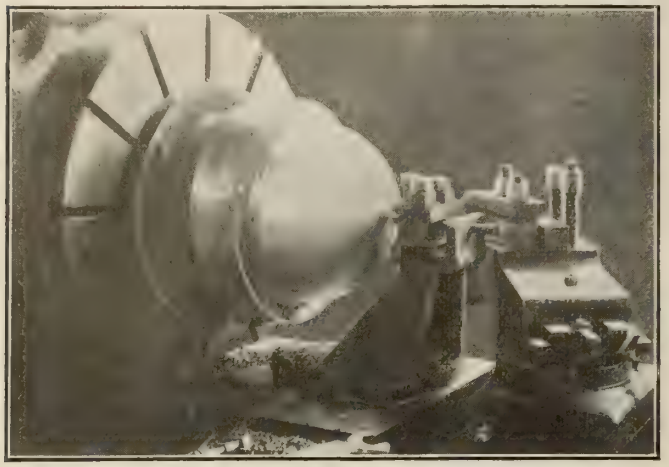

FIG. 9. POSITION OF PARTS AT END OF CUT.

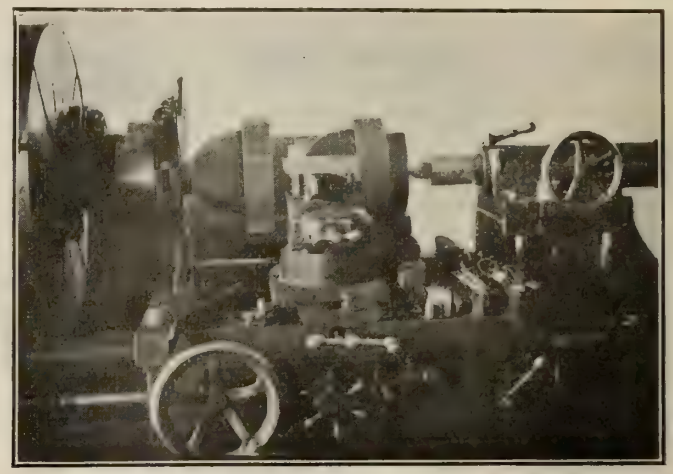

FIG. 10. ROUGHING OUT THE PINTLE.

## PREVENTION OF SPARKING OF SMALL DYNAMOS.

By "Staveley."

WITH the increased use of dynamos and small direct current motors, the careful supervision of the commutator is an absolute necessity in the matters of economy and efficiency. Sparking at the brushes should not be tolerated, and the following suggestions will no doubt help in cases where the spark trouble is existing. Two conditions are necessary.

1.—The commutator must be in good condition.

2.—The brushes must be properly adjusted.

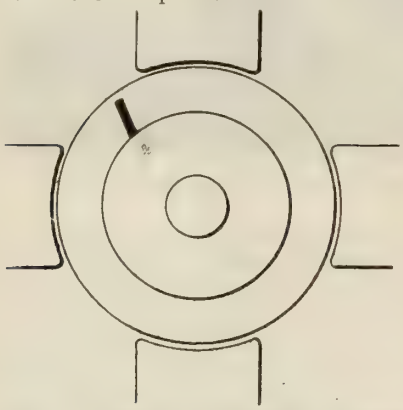

FIG. 1. ANGULAR POSITION OF BRUSH RELATIVE TO COMMUTATOR.

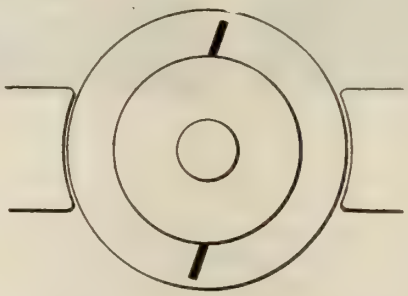

FIG. 2. POSITION OF BRUSHES FOR BI-POLAR MACHINE.

If the commutator is badly scored, or out of round, it should be taken to the lathe, trued up with very light cuts, and carefully polished with very fine emery cloth, all dust being carefully blown off. Smear the commutator with vaseline and then wipe off with dry duck, not with cotton waste. When the shaft has been replaced, all commutator connections should be examined to see that they are sound, and that the insulation is good.

The brush-holders can now be placed in position, having been previously cleaned and examined. The brushes should be inclined at an angle of about 60 degrees and the end of one brush should be wide enough to nearly cover two consecutive segments. There are several types of brushes now in use, but for many purposes a folded copper gauze brush is very suitable, it being light and flexible and, from necessity, must bear with light pressure on the commutator.

Now the position of the brushes is determined from the nature of the machine, that is, whether it be a two-pole-two-brush, four-pole-four-brush, or four-pole-two-brush. Suppose the commutator is made up of 80 segments, then mark one of these permanently as O. With a two-pole-two-brush machine, the positions of the brushes are primarily at 0 and 40, Fig. 2; with a four-pole-four-brush machine the positions are 0, 20, 40, and 60; and with a four-pole-two-brush machine the positions are 0 and 20, Figs. 3 and 4. These numbers can be marked

## CONCERNING FOUNDRY COKE.

By "Melter."

COKE consists of carbon and ash with a small percentage of volatile matter, and is the residue from the expulsion of the large percentage of the latter from coal through the medium of heat. This volatile matter consists of hydrogen and oxygen, combined with each other and carbon, and is set free by the breaking up of the coal. Some of its compounds form gases and others when vaporised are condensed.

### Coke Ovens.

There are several types of coke ovens, but here we shall consider only the beehive and by-product forms.

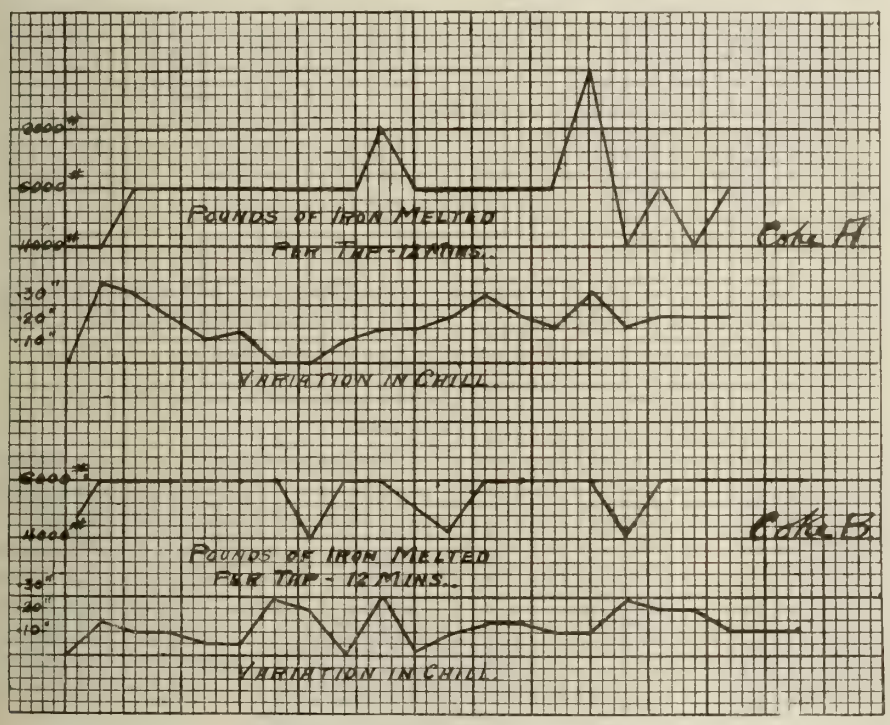
In the beehive oven, all the volatiles are burned in the same chamber adjacent to and above the coal. Heat is radiated from the top of chamber and, therefore, this allows some burning of the coke at the top.

In the by-product oven the volatiles are first taken away, then the tar and benzol are extracted by cooling, while the residual gases are returned and burnt in the flues around the oven; only as much hot air as is required being admitted. When the coal is coked, it is pushed out and quenched with water. In the beehive process, on the other hand, the whole oven is cooled which means that the next charge is heated up slower and proceeds slower. In the by-product oven, coal of high and low volatile constitution may be mixed to obtain best results.

The principal points to consider in choosing a coke for foundry purposes are:—Strength, density, melting rates, uniformity, sulphur, even taps, condition of cupola and ladles, height at which melting zone can be established and maintained.

Strength is necessary to resist breaking-up in handling—the waste being sometimes as high as 2%, and in crushing when throwing in the charge. If the coke be broken small, the amount of surface which is being burned is increased and, if the heat be not utilized as fast as produced, it is wasted.

Some founders make a shatter test by dropping 50 pounds of coke from a height of 6 feet, four times and, if the amount retained on a 2-inch screen be 80% or over, the coke is considered sufficiently strong. An authority whose name I cannot remember, gives the strength of beehive oven coke as 300 lbs. and by-product oven coke made from the same coal in each case as 940 lbs. per cubic inch.



Pounds of Iron Melted Per Tap - 12 Mins.
Coke A
Variation in Chill.
Pounds of Iron Melted Per Tap - 12 Mins.
Coke B
Variation in Chill.

COKE CONSTITUENT COMPARISON DIAGRAM.

Density determines the concentration of heat possible. For every quantity of heat there is a quantity of coke to be burned and air to be supplied and, to consume the fuel economically, there must be concentration. Heat is supplied by contact with the coke also by gases and contact of metal with other hot metal. If one coke is denser than the other, there will be less area in the denser for equal weights, and the concentration will be greater on the denser consequently, all other things being equal, a dense, strong coke is better than a light, weak one.

Uniformity in analysis and structure from day to day means that a foundryman does not have to be continually altering weight of iron charges or varying quantity of coke to correct irregularities. This is explained by the fact that hard coke requires more blast and soft coke less blast. If we have hard and soft coke in the same cupola, and are in the act of heating metal with the hard product, the soft coke above or adjacent will be burning due to the air blast not all being consumed but working up through the charge. When the next charge descends to the melting zone, there will be insufficient coke, which means more oxidation of silicon, manganese and carbon with resultant harder iron, also colder.

Sulphur is injurious to iron and when melting in a cupola, in most cases, iron will absorb it. A coke which is high in carbon and which melts iron quickly even though high in sulphur, may be more beneficial for use than a slow melting coke lower in sulphur and which keeps the iron in contact with it for a longer period and which forms a thick, sticky slag, more or less conducive to high sulphur iron.

In the illustration, H represents a high sulphur coke, while coke B contains just half as much sulphur. It will be noted in the first mentioned coke that the curve showing variation in chill is erratic, the normal chill being .15 ins. It will also be noted that, while coke A is a faster melting product, coke B melts more uniformly. Both these fuels are by-product and have a very similar analysis with the exception of the sulphur and ash feature. Coke B is claimed to produce less slag and to require less limestone. We would not, however, judge from the analyses that such would be the case, but rather the reverse. The fact, although not yet determined, may be due to greater uniformity of size and slower burning, thus not allowing the blast to sluff off the brick lining. Coke B shows high in phosphorus, but

this feature is watched so closely by manufacturers that no trouble is likely to result.

The A coke is hard, tough and much denser than B, their respective weights being 21 lbs. and 30 lbs. per cubic foot. Coke B, however, appears to have greater strength when incandescent, and requires less blast pressure for equal results, which may also be accounted for by the above-mentioned characteristics. To prove the contention that coke B was stronger when incandescent and did not burn away as rapidly in spite of its physical appearance when cold, the illustration shows consistently a softer chill. There was also hotter iron and a greater percentage left in the cupola after dropping bottom.

While the results obtained by using coke are largely a matter of product, it is often possible to vitiate these results by a poor understanding of the most ordinary laws governing combustion and general cupola practice:

| | Coke A. | Coke B. |
|---|---|---|
| Carbon | 91.05 | 90.00 |
| Volatile combustible matter | 3.65 | 1.30 |
| Ash | 5.50 | 8.50 |
| Sulphur | 1.00 | 0.50 |
| B. T. U. | 11,900 | 11,800 |
| **Ash Analysis.** | | |
| Silica | 38.97 | 50.33 |
| Alumina | 28.94 | 32.28 |
| Iron Oxide | 23.23 | 8.53 |
| Lime | 3.32 | 1.08 |
| Magnesia | 0.68 | 1.14 |
| Phosphoric Acid | 1.06 | 3.82 |
| Sulphuric Anhydride | 0.85 | 1.85 |

## WAR SCRAP.

IN an article upon "War Scrap," in a recent issue of the Foundry Trade Journal, the author says that before very long there is no doubt that a large quantity of cast scrap iron and steel will be available.

In dealing with war scrap there is as a rule a fair bulk of unbroken shells as well as broken stuff of various kinds and, with the unbroken shells considerable care has to be taken, as there is always a risk of having one or more fully charged. Needless to say, a charged shell is a very dangerous thing to get into a cupola, because in the event of even a 3-in. or 75 mm. shell exploding, in all probability the cupola would be wrecked and other damage done, while the workmen would probably receive more or less injury.

For this reason all unbroken shells need special examination, and all those holding anything inside them, or which still are plugged at the charging end, must be laid on one side, either to be dealt with by someone who understands shells, or to be taken away by someone connected with the War Office. A communication to the latter will bring an inspector down pretty quickly where explosive war material is concerned—at least, that has been the writer's experience. The safest course, however, is to insist than only broken shells be sent by the iron merchant, as this places on him the responsibility of dealing with probably dangerous goods.

### The Sorting-out Process.

It is not usual for copper, or copper alloy parts, to be sent out from the merchant's yard, owing to their value, but at times such metals do come out. In one case the writer got over 300 lb. of bronze fittings from a lot of piping coming from a chemical works, and it is interesting to note that $2.50 per ton was allowed off the price of the scrap iron on account of its being very dirty. In dealing with war scrap, however, much of the metal is dirty, and it is quite possible for a fair amount of copper or brass to be missed in the collection and quick overhaul given by the merchants, for which reason the sorting or the metal at the foundry should be done with the view of taking out all foreign metal from the iron.

Do not attempt to take metal plugs out of unbroken shells; it is too risky unless the work is done by skilled men used to the class of projectile dealt with. This matter must be rather carefully kept in mind. Somewhat careful sorting of the metal will have to be done to get different grades, for while most of the iron and steel used is good, there are variations in both quality and hardness, a small Maxim shell being of different quality from a 14-pounder. Many of the shells also are made from scrap metal, which again causes a difference in quality and this has to be considered, but generally a good sorter can turn out very regular piles of graded metal for most purposes.

For work which has not to be made to any particular specification, old scrap from the battlefield forms a fairly cheap and handy form of metal, and probably will form a large part of the iron used in many places in the near future, as the supply will be extremely large. Probably some kind of flux will be necessary in the furnace when melting to secure the better amalgamation of the different irons, but will only be determinable where the scrap is being dealt with.

Other scrap, such as cartridge shells, rings, and plugs from heavy gun shells, bullets with their nickel cases loaded with lead, and similar waste, will be collected and eventually find their way into the hands of melters and foundrymen, and as they are all good metal according to their kind, they usually are worth buying. Some care is necessary to see that live cartridges are not present amongst the smaller stuff, and as a rule cartridge cases should be melted by themselves after careful sorting and examination. Denotations sometimes occur where cartridges have not exploded and such things should be viewed with suspicion, although they are not always dangerous.

In sorting this form of scrap, brass, gunmetal and copper, nickel and lead will be found, and as each is of good quality, the metals can be used right away, but generally it is desirable that they should first be run into ingots to maintain regularity of content. Of course, the bullets will be heated to separate the lead from the nickel, the molten lead being at once run into ingots, while the nickel shells, after being well roused about to shake out the molten lead, will have to be melted down in crucibles. In this sort of work, large crucibles of at least 4-cwt. capacity should be used, and for this purpose tilting furnaces will be found very convenient. Most of the soft scrap metal requires the use of some deoxidant flux when melting for making into ingots, but after being once cleaned out there should be no further difficulty in regard to occluded oxides and dirt, the actual casting work being practically the same as with new metal.

## PREVENTING OF SPARKING OF SMALL DYNAMOS.

(Continued from page 134.)

permanently on segments where convenient.

Having now fixed in the brushes and bedded them nicely on the commutator, with light pressure, start up slowly and run for a while, wiping the commutator with dry duck if necessary. If commutator and brushes tend to bind at first, apply a very little vaseline to just lubricate. Now increase the speed, and if sparking occurs, adjust the rocker-arm, bearing in mind that for increased load, brushes go forward, and vice versa. If commutators and brushes be examined at stated intervals, say every week, and records be kept of the date when adjustments or renewals are made, of original maker's diameter of commutator, size of segments, insulation, etc., diameter when trued up, etc., breakdowns and burnouts will be greatly reduced. Further, and what is perhaps more important, you know in your private office whether the commutator trouble is with the man or with the machine when the current becomes erratic.

# PROGRESS IN NEW EQUIPMENT

## A Record of New and Improved Machinery and Accessories for the Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

### NEW AUTOMATIC NUT-TAPPING MACHINE.

MORE energy and inventive genius have been expended, perhaps, on the bent or curved tap principle in an effort to develop a continuous, non-reversing nut tapper than have been spent in the development of any other class or type of bolt and nut machinery. Numerous firms and individuals have experimented extensively with the bent tap, and while in theory all the requisite steps or movements, from the introduction of the nut blank to its ejection as a tapped nut, have apparently been successfully evolved, in practice the various designs show shortcomings more or less fatal commercially.

Nevertheless, the quest or effort to utilize the bent tap has gone on uninterruptedly, as the degree of success attained indicated that the bent tap held much promise and, that in theory at least, it offered the way for a full automatic nut tapper without any reversing action to wear out taps and cause trouble, and in which the various movements would be obtainable without the employment of intricate or delicate mechanism, which has brought automatic tappers into ill favor generally, because of the constant and expert attention necessary.

These possibilities have, it is claimed, now been realized in a new automatic nut tapper being offered by the National Machinery Co., Tiffin, Ohio, and on lines even simpler than embodied in the theories and dreams of the early experimenters. This tapper is being built in sizes of $\frac{1}{4}$, $\frac{3}{8}$, $\frac{1}{2}$ and $\frac{3}{4}$ inch capacity, and the various illustrations show the movements and operation.

FIG. 1. NATIONAL AUTOMATIC NUT TAPPER.

The hopper or container for the blanks, while apparently on accepted lines, embodies sime original ideas and is made unusually large. On the smaller size machines, it accommodates about 80 lb. of blanks, this giving the operator considerable time between fillings, and enabling him to easily attend a battery of from 6 to 10 machines. A vane type feed progresses the nuts from the hopper to the feed chute, and gravity brings the blanks down and into position against the plunger or starter. There are four of these feed vanes, and they are so enclosed that the pressure or weight of the blanks cannot interfere with their successful operation. These vanes are rotated by a ratchet and pawl off the driving shaft, and this ratchet is held between friction flanges so that in case scrap or thin nut blanks tend to wedge in the nut groove and interfere with the vanes, the ratchet merely slips, and damage is prevented.

The tap spindle and injector or starter are inclined at an angle, and the blanks come out of the feed chute at a like angle, causing each blank to lay against the starter as it is advanced onto the tap. The angle of the starter is such that the lubricant keeps the face free of chips, and the blanks lay or bear flush against the starter, and are thus tapped square with the bearing face.

The tap spindle has a slight lateral travel, and is counterbalanced, giving the spindle a floating movement in a sense, and after the starter has fed the blank part way onto the tap, the spindle descends during the completion of the tapping, thus keeping the blank stationary while it is being tapped, in place of pulling it through the nut holder or guides, and incurring a chance of binding, with attendant excessive wear on the nut guides and tap.

The course of the nut after being

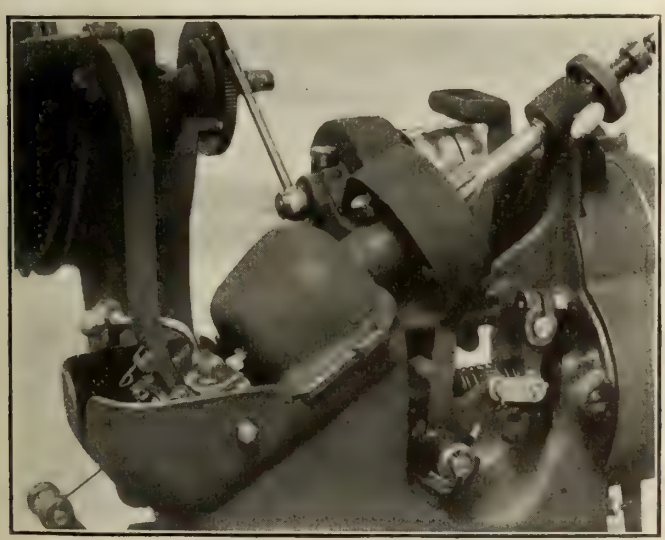


FIG. 2. NEAR VIEW OF WORKING MECHANISM, SHOWING HOW ALL GEARS AND REVOLVING PARTS ARE GUARDED.

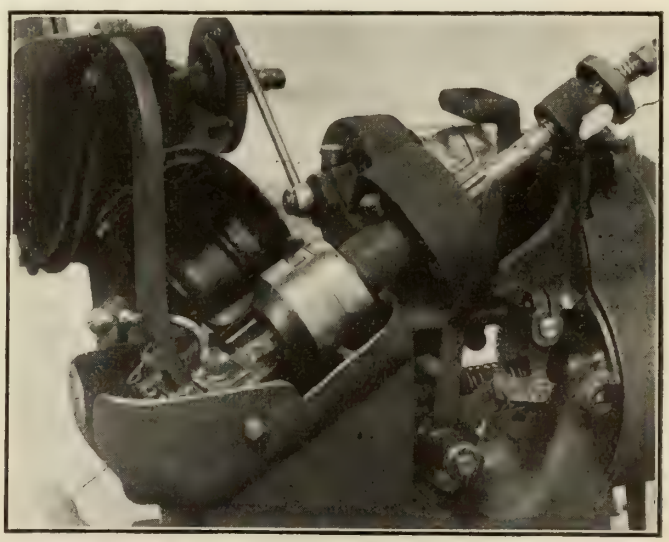

FIG. 3. HEAD COVER OR GUARD OPEN, SHOWING A NUT ABOUT TO BE EJECTED FROM THE HEAD. THIS COVER OR GUARD DIRECTS THE EJECTED NUTS.

tapped, i.e., its travel up the shank and off the end of the tap, is made clear in Fig. 4. The hood or cover over the head serves to direct the nuts ejected from the tap into a chute that conveys them out of the machine into boxes or kegs.

It follows, of course, that the better the quality of blank being tapped, i.e., freedom from burr, holes of correct size, stock free cutting and blanks of correct dimensions—the higher the machine's efficiency, and all blanks before being dumped into the hoppers are sorted for scrap, slugs, etc.; but should any scrap accidentally enter and be passed through the feed chute and fed against the tap, an automatic relief shifts the belt and stops the machine.

The design is intended primarily for tapping square nuts, but hexagon nuts of good quality can be handled; and each size tapper can be tooled for handling both styles of nuts, as well as for several sizes. Also by making a simple gear change, the rate of feeding, number of nuts tapped per minute, can be regulated to suit the kind of nuts being tapped. As an example, in the ⅜-inch size machine, 40 nuts of shop size can be tapped per minute if the stock if free-cutting, and holes are full size, etc.; whereas U.S.S. nuts being thicker require more turns of the tap to a nut, hence 30 nuts per minute are recommended. This also applies when nuts are of tough stock or the holes run smaller than standard.

No special type or grade of tap is necessary, and any standard tap that has been successfully employed in a shop in the straight shank will be found equally satisfactory in the bent form for this new automatic tapper.

These tappers, we understand, have been installed in a number of the big nut plants, and are showing a high efficiency. The absence of intricate mechanism and delicate parts in this tapper means elimination of much petty repair and more or less constant attention.

FIG. 4. HEAD OR TAP HOLDER OPENED, SHOWING HOW THE NUTS PASS OVER THE TAP AND ARE EVENTUALLY PUSHED OFF OR EJECTED BY ONCOMING NUTS.

FIG. 5. DETAIL VIEW SHOWING LARGE HOPPER, ALSO RATCHET AND PAWL WHICH ROTATE THE CONCEALED FEED VANES.

## DRY DOCK EQUIPMENT CONTRACT.

THE general contractors for the Lauzon Dry Dock, Quebec, M. P. and J. T. Davis, have awarded the Canadian General Electric Company the contract for the apparatus required in the engine room and pump house. It includes three horizontal condensing steam turbo-generators, one of 300 k.w., another of 750 k.w. and a third of 1,500 k.w., with the necessary condensing apparatus, and also a 100 k.w. vertical engine driven direct current generator set.

The main switchboard in the lower house will consist of nine panels, and in the pump house there will be three individual motor panels connected in series with the corresponding panels in the power house, so that the large motors can be controlled at either place. Canadian General Electric Co. apparatus is used throughout. An outstanding feature of the main switchboard is the use of Thompson astatic instruments which are not affected by the heavy stray fields so commonly met with on d.c. switchboards of high ampere capacity. Errors due to such stray fields can only be avoided by using properly shielded instruments which have the fields astatically arranged.

For general drainage purpose there will be two Mather & Platt axial flow centrifugal pumps each of 6,000 Imperial gallons per minute capacity against 40 ft. head and driven by a 125 h.p. motor. For the main dock there will be three Mather & Platt 42-in. axial flow centrifugal pumps, each designed for 63,000 Imperials gallons per minute against a head of 25 feet. Each of these pumps will be driven by a 750 h.p. motor. There will also be a Mather & Platt new type centrifugal pump capable of handling 2,600 U.S. galons per minute against a head of 25 feet for hot-well purposes, and standard underwriters' steam fire pump of 500 gallons per minute, two outside end-packed boiler feed pumps, a Cochrane feed water heater and other appliances.

## ELECTRO-DEPOSITING.

ELECTRO-DEPOSITING is very largely used in printing offices, not only in the making of process blocks, but also in plating or facing stereotypes with copper or nickel for the purpose of hardening the surface and permitting much longer runs than is possible from the plain stereo. Ordinary copper electrotypes, when not nickel-faced, soon wear down, and give a poor impression.

The usual method of making an electrotype of a process block or an engraving in an electrically-driven works is to first of all prepare a wax mould in the electrically-driven hydraulic press. The surface of this is then rendered conducting by treatment in an electrically-driven black-leading machine, and a copper shell is then deposited on the wax mould in the electric bath, the shell being afterwards backed up with molten metal and fixed to a wood block "type high." For long runs, the face of the block may be nickel-plated. The latest method is to electrically deposit nickel steel direct on to the prepared wax mould, a very thin deposit only being necessary. The mould is then washed and transferred to the copper bath, where it is electrically backed up with copper and is afterwards backed and prepared in the usual way.

## 'TIS NO TIME TO WHINE.

HOWEVER unconsciously we may have become participants in this almost all-European War, there is no disputing the fact that, as the weeks and months have sped since early August last, we have been in process of realizing that not only were we involved but, as a privilege and of necessity, we had also a duty to perform. In these particulars as regards accomplishment we have nothing to be ashamed of and we no doubt are determined to surpass rather than merely maintain the present achievement record. It may at once be said that we have given quite unstintingly of our manhood, our womanhood and our substance for the cause of Empire, notwithstanding which, as a nation within that Empire we are relatively richer in many respects than otherwise.

Within the past week we have again been reminded—rather more forcibly perhaps because of its imperiousness, that we are involved with Britain, and that her affairs, of whatever nature, are ours as well. Canada's War Budget has been declared, and even though as regards details, to a large extent anticipated, it has, judging by appearances and noting observations, aroused considerable excitement and caused much commotion in the various spheres of our commercial, domestic and individual relationships and activities.

Arising out of the Budget proposals generally, as was naturally to be expected, all manner of extravagant ideas and statements are being promulgated. Business men we are led to believe have been precipitated headlong into a maze of figures and probabilities, and numbers of them—we had almost quoted Scripture, and said: "A multitude of them that no man could number,"—are ready to shut down. Criticism of certain details has also not been lacking in the elapsed although short period, and while always justifiable for cause or reason, may nevertheless often be narrow and circumscribed in its outlook.

In its essence, our War Budget gives added protection generally to Canadian manufactured products and at the same time added preference comparatively to imports from Britain. The latter, however, is meantime and will continue to be for the next two years or more somewhat of an "intangible asset" to British manufacturers, due to the fact that their output for home requirements is and will continue to be for at least the period named, far below the demand.

Regarding the 7½ per cent. increase in non-preferential instances, it may be incidentally remarked that the amount is substantial, but at the same time neither a real or imaginary barrier to hinder anyone purchasing what they want, just because they want it from necessity. As long as there are seams in the board fence round the ball yard there will be fans outside as well as inside following the game, and in like manner no tariff however apparently prohibitive will stand in the way of those who want to see, know and participate in machinery improvements, etc.

The Minister of Finance has taken full and cunning advantage of the exceptional opportunity afforded. He has not only sought by the various enactments to foster Canadian industry, but he has done so at a time when tariff or no tariff, the all pervading application of our varied enterprise is that due to the European War, and for the profitable accomplishment of which we have had and will have of necessity to import largely.

The purpose of the tariff and tax imposts, particulars of which are to be found in another section of this issue, is to provide additional revenue, and this can best be achieved by our practising "Business as Usual." This, mark you, has no kinship with the "Business as Usual" propaganda with which the opening weeks of the war was haloed. Rather is it the unaffected war-tariff-and-tax—unconscious pursuit of our affairs that has in recent weeks marked our steady uplift to early future normal times again.

We have said that criticism of the Budget provisions is in evidence, and some people individually or collectively, or both, may be rather heavy sufferers comparatively. A number of the enactments are almost sure to become permanent; as for instance the stamps on commercial paper, while others again may be more or less tardy of erasure from the statutes. In any case, the personal and individual exemptions as burden bearers are few, and taken altogether, who of us would be disposed to bear any less share in supporting our Empire in the cause to which she with her Allies have committed themselves?

Canada's 1915 Budget is a call to her people's patriotism, and that they will respond equally whole-heartedly as with her sons and daughters there is not a glimmering of doubt. Let us continue then to make it "Business as Usual."

# The General Market Conditions and Tendencies

**This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.**

**Montreal, Que., Feb. 15, 1915.**—Perhaps the most interesting event of the week in industrial circles has been the announcement of the tariff changes and the war taxes. The declaration will have a direct effect on the steel trade, because of its bearing on imported steel goods. As regards pig iron, prices all around will be increased from one to two dollars per ton. Pervading the steel trade, there is a much better feeling, and it is very confidently expected that business will develop satisfactorily as far as Canadian mills are concerned. At the moment, however, conditions are much as they have been for the last six weeks.

In metals there has been a general increase in price, due to the increased duty. Business here also has been much as usual during the week, there having been no particularly interesting developments and no price changes of note.

#### The Steel Market.

Inquiries being received for steel are quite encouraging, and a considerable amount of business is likely to result from them later. Orders for shrapnel shells continue to be placed in Canada, and this war-time industry is contributing to the keeping of our machine shops busy.

#### Pig Iron.

About the same volume of business continues to be accorded in pig iron. The general condition, however, represents a very dull market. Prices will go up on all imported material because of

the new tariff regulations, and home brands will no doubt follow suit. The meantime effect will not be as noticeable as it will be later when the requirements begin to tend towards normal.

### Machine Tools.

In general lines of machine tools little or no trade is passing, but in the matter of specialties, etc., for machining shrapnel shells, the demand continues good, although it is almost impossible to get deliveries under two or three months.

### Machine Shop Supplies.

In bolts, nuts, screws, and rivets there will undoubtedly be a decided price increase as soon as matters are adjusted, but at the time of writing no advances have been made. For wrought pipe, boiler tubes, copper rivets, etc., increases have already taken place. Tool steel will also register an advance. Metal sheets have gone up considerably. Business in supplies has been very good of late on account of the increasing number of shops engaged in war orders.

### Metals.

On account of the increased duty, copper of all grades has gone up from $1 to $1.10 per hundred pounds. Lead has gone up one-quarter of a cent per pound. Tin has gone up 2½ cents per pound. Spelter, antimony and aluminum have also advanced. Business has been rather free from startling developments during the week.

---

**Toronto, Ont., Feb. 16, 1915.**—The outstanding topic this week in business circles is the new tariff schedule, and opinions naturally vary as to the effect that it will have on trade. It is generally considered to be fair and equitable and that under prevailing conditions very little dislocation will be experienced. There will of necessity be extra labor entailed in preparing price sheets and some time may elapse before the situation is entirely adjusted. As the entire schedule with few exceptions has been increased 7½ per cent., or the intermediate and general tariff, and 5 per cent. on the preferential, it follows that there will be a corresponding advance in the price of imported goods. No information is available as yet as to what action Canadian manufacturers generally will take on account of the tariff on raw materials, but it is probable that in some cases they will increase their prices. In some instances this has already happened. The higher tariff may have the effect of temporarily depressing business to some extent, as for some time past consumers have been restricting their buying to such goods as were most urgently needed. Apart from the question of increased revenues and the benefits derived therefrom, the higher tariff will be of some assistance to Canadian manufacturers notwithstanding the higher cost of raw materials. Our manufacturers should be able to turn the situation to good account by establishing new connections and generally developing their business.

The iron and steel trade has not, so far, been materially affected by the tariff, and business is quiet. Prices on domestic products are unchanged with the exception of wrought iron pipe which has advanced. Scrap copper prices are higher on account of the continued strength in the copper market but other lines are unchanged. Tin and spelter are higher but other metals are unchanged except for the addition of 7½ per cent. duty to the last quotations. The machine tool market is quieter but some nice business is in view. The supply business is quiet, and imported goods have advanced.

### Steel Trade.

The new tariff may be of some benefit to the iron and steel trade, but business has been so dull of late that it is doubtful whether under prevailing conditions much development can be expected even with a higher tariff. When industrial conditions improve, the steel trade will benefit to a greater degree than under the old tariff as outside competition will be restricted to the extent of the extra duties. Prices on all steel products entering Canada have been advanced. Pittsburgh bars, plates and shapes laid down in Canada are approximately $1.80 per 100 pounds higher, but warehouse prices have not been changed for the present. Galvanized, black sheets and Canada plates have advanced 10c per 100 pounds. Boiler plates and tubes are higher, and the discounts on cold drawn steel shafting are being adjusted. Wire nails, galvanized and barbed wire have advanced 5c per 100 pounds at Pittsburgh. There has been no change so far in the prices of domestic steel products, except in wrought iron pipe, which will be referred to later.

### Pig Iron.

The duty on pig iron has been increased, but the tonnage now being imported is comparatively light, so the effect will not be very noticeable at present. There has been an all round advance in prices on account of the tariff.

### Machine Tools.

There has been diminished activity in the machine tool trade this week, although orders continue to be placed for equipment for machining shells. Business in other lines is quiet. The increase in tariff will probably not greatly affect the import trade, as only special tools and those urgently required have been coming in recently. There is a possibility of Canadian makers benefiting by the tariff when conditions improve, but at present there is not much demand for tools other than those used for making shells.

### Supplies.

There is a little better demand for supplies. Prices on imported lines have advanced and lists are being revised. Prices of supplies made in Canada are unchanged and no information is available as to what steps manufacturers propose taking. Indications are that the higher duties will increase the demand for domestic goods. Linseed oil has advanced 2 cents, being now quoted at 70c per gallon for raw and 73c for boiled. Turpentine is unchanged but the higher tariff may cause an advance. A revision in the price list of cotton waste is anticipated.

### Metals.

Metals in the form of ingots or pigs have until recently entered Canada free of duty. They are now dutiable to the extent of 7½ per cent., which is included in this week's quotations. There is a fair demand locally and quotations are firm. Tin and spelter have advanced 1c and 1½c per pound respectively. Other metals are unchanged except of course for the duty, 7½ per cent., which is included in all cases. Tin is higher in the primary market and is firm on account of large demand. Tin is now quoted at 43c per pound. The copper market is quiet and unchanged at New York. Lake copper is quoted locally at 16½c per pound. The spelter market continues to move up and is strong, and spelter is quoted at 10¾c per pound. There is a good demand for lead, and the market is firm with the possibility of an advance. In the local market the price is 5½c per pound. Antimony is strong at 20½c per pound, but aluminum is dull at 23½c per pound.

### Scrap Metals.

The recent advance in the copper market has affected scrap copper, and prices have advanced ½c per pound. The following are the new quotations: Light copper, 9½c; crucible, 10½c; heavy, 10½c; wire, 10½c; composition, 9½c; brass clippings, 8c; brass turnings, 6¾c per pound. Scrap zinc is now quoted at 5c per pound.

### W. I. Pipe.

Prices of wrought iron pipe have been advanced. The new discounts, which went into effect on Feb. 13, are given in the selected market quotations.

---

**The General Machinery Co. of Montmagny, Que.**, and the F. X. Drolet Co., Quebec City, have, it is understood, received contracts for shells from the British Government.

# Canada's War Budget--Tariff Changes and Tax Impositions

*Anticipation that the Budget for 1915 would be of more than usual individual interest has been quite fully realized, and in order that our readers may readily familiarize themselves with its aims, provisions, etc., there is provided the following detail summaries:*

THE European war has affected the finances of Canada in two ways. It curtailed trade, which meant a reduction in the customs revenue, and made necessary expenditures which almost doubled the demands upon the treasury; besides, this came at a time when large obligations had been assumed for public works, and there had been going on for years development of administrative activities which meant heavy and permanent increase of the regular expenditures.

The estimates for the coming year laid before Parliament call for $146,000,000 for ordinary Governmental work and $44,000,000 additional for such purposes as completing the National Transcontinental Railway, constructing the Welland and other canals, and improving facilities for navigation. Then there is the war expenditure, for which a vote of a hundred million dollars is asked for the coming fiscal year, making the whole amount that may be required during the twelve months close to $300,000,000.

The probable revenue is only $120,000,000, but arrangements have been made with the British Government for obtaining the money needed for the war at a low rate of interest. There will still be the necessity, however, for heavy borrowing for purposes other than that of the war.

Some $30,000,000 has been reckoned necessary to meet the increased interest charges, to bring revenue up to normal or ordinary expenditure, as well as to ensure a balance against eventualities

## WAR BUDGET SUMMARY

**Briefly stated, with a small list of exceptions, there is a general all-round increase of 7½ per cent. on the general and five per cent. in the British preferential tariff.**

**Special war taxes are imposed upon banks, insurance companies, railways, cable and telegraph companies and patent medicines.**

**On bank note circulation there is to be a tax of one per cent., and on trust and loan companies a tax of one per cent. on the gross income.**

**Insurance companies, except life and marine concerns, will pay one per cent. of net premiums**

**All cable and telegraph messages will pay a tax of one cent each.**

**From all railway and steamship tickets, the Government will collect five cents from each, where the ticket costs up to $5, and five cents for each additional $5 of cost.**

**On parlor car seats and sleeping berths there will be a tax of 10 cents each.**

**A tax of $1 is levied on steamship tickets costing up to $10 to all points other than in Canada, U.S. or West Indies; $3 for berths exceeding $30; and $5 for berths over $60.**

**There will be a stamp tax of 2 cents upon commercial paper, such as receipts, checks, transfer and business agreements, as well as on express and money orders.**

**Every letter and post card will bear a one-cent war stamp, bills of lading a two-cent stamp and postal notes one cent; patent medicines one cent for each ten cents of cost.**

**Upon non-sparkling wines there will be a tax of five cents per quart; upon champagne, 25 cents per quart.**

**By reason of the trade conventions with the British West Indies and France the increased duties do not apply to silk fabrics, velvets, ribbons and embroideries.**

## EXEMPTIONS FROM TARIFF INCREASE.

**The list of items in the tariff schedules or in the former free list which are exempt from the general tariff increase announced, is as follows:**

**Fish from Newfoundland, animals for the improvement of stock, cocoa and chocolate products, tea, salt for the fisheries, Indian corn except for distillation purposes, wheat, wheat flour, sweetened biscuits, squid, oysters, seed and breeding; fish and fish eggs for propagating purposes; sugar, tobacco, wines from South Africa; books (printed), newspapers and magazines, news printing paper, matrix paper; nicotine sulphate, ores of metals, bells for churches; gold and silver coin and gold and silver ingots, blocks, bars, drops, etc.; typesetting and typecasting machines, newspaper printing presses; mowers, binders, harvesters and reapers, traction ditching machines; surgical and dental instruments; material for ships, binder twine, articles for the manufacture of binder twine, fish hooks, lines, twines and nets for the fisheries, artificial limbs, artificial teeth not mounted, articles specified in tariff for schools, hospitals and charitable objects, settler's effects. The customs duties on the foregoing remain unchanged.**

**Only five specific agricultural implements are exempt from increase in duty, viz:—**

**Reapers, binders, mowers, harvesters and ditching machines. All others are subject to the 7½ per cent. increase, which means an average increase from 20 to 27½ per cent. on ploughs, cultivators, harrows, discs, threshing machines, waggons, etc.**

**The tariff changes, according to custom, went into effect immediately on announcement, February 11. With regard to the special taxes, those on wine and champagne go into effect at once, and the others at a date to be fixed.**

and, to provide this, a general tariff increase has been imposed of seven and a half per cent., general and intermediate, and five per cent. preferential, applying to all articles whether now dutiable or on the free list, with, however, a list of exemptions, including tea, cocoa and chocolate, sugar, wheat and wheat flour, tobacco, books, newspapers and magazines, agricultural implements. From the operation of the foregoing, a revenue of from $20,000,000 to $25,000,000 is anticipated.

In addition, special war taxes are imposed on banks, insurance, railway, cable and telegraph companies, and on patent medicines, from which sources a revenue of some $8,000,000 is expected.

In the accompanying table, columns 1 and 2, are shown the general nature and monetary value of the business done by Canada during the last year, while, based on same, in column 3 is given the revenue arising out of the new tariff and tax impositions. From the latter figures it will be noted that there is a close approximation to the $30,000,000 expected to be raised.

**Dutiable Goods.**

| | Value | War Tax |
|---|---|---|
| Bar iron, etc. | $ 3,700,000 | $ 277,500 |
| Castings | 1,400,000 | 105,000 |
| Gas engines | 2,500,000 | 187,500 |
| Pipe fittings | 1,000,000 | 75,000 |
| Bridges | 1,000,000 | 75,000 |
| Pig iron | 2,500,000 | 187,500 |
| Portable engines | 2,300,000 | 172,500 |
| Threshing machinery | 1,200,000 | 90,000 |
| Spinning machinery | 1,800,000 | 135,000 |
| Machinery | 14,800,000 | 1,100,000 |
| Steel rails | 5,000,000 | 375,000 |
| Steel angles, etc. | 2,800,000 | 210,000 |
| Rolled beams | 6,000,000 | 450,000 |
| Steel plates | 4,600,000 | 345,000 |
| Galvanized sheets | 1,000,000 | 75,000 |
| Skelp iron | 2,700,000 | 202,500 |
| Iron and steel pipe | 1,300,000 | 101,500 |
| Steel plate, bridges | 1,600,000 | 120,000 |
| Rolled steel bands | 1,000,000 | 75,000 |
| Steel manufactures, N.O.P. | 10,000,000 | 750,000 |
| Jewelry | 1,700,000 | 122,500 |
| Boots and shoes | 4,200,000 | 315,000 |
| Magic lanterns, etc. | 1,200,000 | 90,000 |
| Lamps, etc. | 1,500,000 | 112,500 |
| Nickel-plated ware | 1,400,000 | 105,000 |
| Phonographs, etc. | 1,000,000 | 75,000 |
| Coal oil, etc. | 1,300,000 | 101,500 |

| Total | | $ 7,439,000 |
| Grand total | | $28,276,000 |

## CANADIAN LUMBER OUTPUT.

Despite the depression in construction work throughout the Dominion, lumbering operations upon Crown timber limits in Ontario this winter will measure closely to the records of the past year. One reason for this is that while the market has been falling off, lumbering companies have been able to hire men at lower rates and many are at work, anticipating an improvement in demand next year.

According to estimates received by Aubrey White, Deputy Minister of Crown Lands, the cut of pine this year will amount to approximately 375,000,000 feet, compared with about 360,000,000 last year. The cutting down of railway construction is reflected in a decided falling off in the estimated output of ties. Crown timber limits produced over 6,000,000 ties last year, and unless the estimate of the Government experts is below the mark, the total this year will not reach much above a million.
